Memorandum

To: Carl Puzey Attn: Brad Hessing
From: Michael A. Short By: Jeremy Brown
Subject: Structure Geotechnical Report Disposition *
Date: March 19, 2021

* SN: 046-0161
Route: FAP 41
Section: (12)BR
County: Kankakee
Contract No.: 66F88

Attached is the Structure Geotechnical Report for the subject project.

This letter is to provide revisions to the disposition for SN: 046-0161 which was submitted to the Bureau of Bridges and Structures for review by Jeremy Brown (IDOT D3 Geotechnical Engineer). There were concerns with the revisions in the disposition which are addressed in this letter. These revisions are being provided by Jeremy Brown.

1. It is no longer recommended to drive H-piles to refusal in bedrock. There were concerns with being able to achieve the required 10-foot embedment by driving the piles due to some hard, silty clay and shale layers below the proposed structure.
2. Additional soil borings were conducted along with rock cores sampled at each proposed abutment. Based on the information provided in the attached soil boring and rock core logs, H-piles socketed in rock are recommended for the proposed structure foundations with the following design recommendations.

Location	Bottom of Abut. Elevation	Top of Rock Elevation	Estimated Pile Length	Rock Socket Diameter	Rock Socket Depth
West Abutment	611.69	594.60	22.09 feet 25 feet	30 inch	3 feet 5 feet
East Abutment	611.78	581.20	41.58 feet 44 feet	30 inch	9 feet 11 feet

JB 5/22/21

*Revisions were made based on comments from BBS

The limestone rock samples retrieved were tightly jointed and had very high compressive strength, which exceeded that of concrete strength. The AASTHO design manual suggests using the value of concrete compressive strength if this situation arises. I used a conservative strength estimate of 4,000 psi for the concrete compressive strength. The first 6-feet of rock that was sampled at the east abutment was found to be a poor-quality black shale. This layer was ignored when running the resistance calculations. Due to the high compressive strength of the limestone layers, the required socket depth is relatively small. It is recommended to drill the sockets to a depth of 3-feet into the underlying limestone layers at each abutment, which requires drilling through the 6-foot shale layer at the east abutment. The side resistance provided by socketing 3-feet into limestone is more than ~~double~~ the factored resistance required per H-pile and that doesn't take into consideration any tip resistance, which is more than the side resistance.

:bs/Roadway Geotech Report #66970

Per the comments from the Bureau of Bridges and Structures, it is recommended to drill the sockets to a depth of 5-feet into the underlying limestone layer at each abutment. The depth was increased 2-feet due to the weathered condition of the limestone at the top of the layer. At the east abutment, the 5-feet into limestone is in addition to drilling 6-feet through shale for a total socket length of 11-feet. Extra attention is required while drilling the sockets for the east abutment and the elevation should be recorded when the limestone is encountered. Take note that the strength of the 2-feet of weathered limestone was not used in the calculation for the factored side resistance available. The factored side resistance available was calculated to be 452 Kips using a depth of 3-feet into the limestone and a resistance factor of 0.55.

The Bureau of Bridges and Structures provided the following procedure for backfilling the socketed piles for the piles at both abutments.

- Concrete in rock socket shall continue to 6 inches above the top of the socket elevation.
- Instead of 10 feet of CLSM immediately below the abutment cap, it shall be 10 feet of bentonite.
- CLSM shall be used to fill between the socket concrete and bentonite.

046-0161 (046-0032 Exist)

West Abutment

Top of Rock = 594.60

Side Resistance

$$q_s = 1.0 \sqrt{\frac{576}{2.12}}$$

$$q_s = 34.9 \text{ KSF}$$

$$RAD \ 0'-5' = 30'$$

$$\text{Lowest } Q_u = 618 \text{ TSF} = 1236 \text{ KSF}$$

$$34.9 \times 7.85 = 274 \text{ Kips FT}$$

$$C = 2.5 \text{ D}$$

$$C = 7.85'$$

Tip Resistance

$$q_p = 2.5(576)$$

$$274 \times 3' = 822 \text{ Kips}$$

822 Kips x 0.55 = 452 Kips
Factored Resistance Available

5-22-21

$$A = 17(1.25)^2$$

$$A = 4.91 \text{ SF}$$

$$q_p = 1440 \text{ KSF}$$

$$1440 \times 4.91 = 7070 \text{ Kips}$$

$$7070 \times 0.5 = 3535 \text{ Kips - Factored Resistance}$$

$$\text{Concrete } Q_u = 4000 \text{ PSF} = 576 \text{ KSF}$$

$$1236 > 576$$

East Abutment

Top of Rock = 581.20

Side Resistance

$$q_s = 1.0 \sqrt{\frac{576}{2.12}}$$

$$q_s = 34.9 \text{ KSF}$$

$$RAD \ 6'-13' = 29'$$

$$\text{Lowest } Q_u = 873 \text{ TSF} = 1746 \text{ KSF}$$

$$1746 > 576$$

Tip Resistance

$$q_p = 2.5(576)$$

$$q_p = 1440 \text{ KSF}$$

$$1440 \times 4.91 = 7070 \text{ Kips}$$

$$7070 \times 0.5 = 3535 \text{ Kips - Factored Resistance}$$

Resistances to be used were calculated using
side resistance at a depth of 3 feet into Limestone

Memorandum

To: Carl Puzey Attn: Brad Hessing
From: Michael A. Short By: Jeremy Brown *JB*
Subject: Structure Geotechnical Report Disposition *
Date: August 31, 2020

* SN: 046-0161
Route: FAP 41
Section: (12)BR
County: Kankakee
Contract No.: 66970

Attached is the Structure Geotechnical Report for the subject project.

This disposition is to provide revisions to the SGR for SN: 046-0161 which was submitted to the Bureau of Bridges and Structures for review by Mark Jones of McCleary Engineering. These revisions are being provided by Jeremy Brown (IDOT D3 Geotechnical Engineer). The first three responses below are direct responses to the speed letter that was provided from the Bridge Office. The remaining items are additional corrections that are being made.

1. It is no longer recommended to core to bedrock and socket the H-piles in rock. It is recommended to drive H-piles to refusal in the underlying limestone layer.
2. We have revised the Integral Abutment Feasibility Spreadsheet and have determined integral abutments are feasible without the need to precore. The updated spreadsheet is attached.
3. Rock sockets are no longer recommended for the proposed H-piles. It is recommended to drive H-piles to refusal in bedrock utilizing pile shoes. We have updated the IDOT Static Method of Estimating Pile Length spreadsheet. Due to the similarity of the pile cutoff elevations and the subsurface conditions, the data from the east abutment is being used to represent both abutments. Due to the consistency of the top of rock elevations, it is recommended to not include test piles, but instead to assume a pile length of 30 feet (26 feet plus 4 feet for variation in top or rock elevations).
4. We have updated the Seismic Site Class Determination Spreadsheet. The updated spreadsheet is attached.
5. There was an error found in one of the boring logs in the original report. The updated boring logs are attached.

If you have any questions, please contact Jeremy Brown at 815-433-7098.

Abbreviated Structure Geotechnical Report

Original Report Date: 6/25/2020 Proposed SN: 046-0161 Route: FAP 41 (IL 17)
Revised Date: _____ Existing SN: 046-0032 Section: 12-BR
Geotechnical Engineer: Mark Jones of McCleary Engineering County: Kankakee
Structural Engineer: William Vegrzyn of V3 Companies Contract: 66970

Indicate the proposed structure type, substructure types, and foundation locations (attach plan and elevation drawing): The proposed structure SN046-0161 carries IL 17 over the east branch of Horse Creek. The structure is a single span bridge with integral abutments, no skew, with an out to out superstructure width of 38.83 ft. and a back to back abutment length of 103.0 ft. The estimated total factored loading at the abutments is 1920 kips. The abutments will be supported by steel piles set in limestone.

Discuss the existing boring data, existing plans foundation information, new subsurface exploration and need for any additional exploration to be provided with SGR Technical Memo (attach all data and subsurface profile plot): The existing structure SN 046-0032 is a three-span bridge on open abutments supported on piling. The piers are on spread footings.

Four (4) borings were available from August 1958, these borings all show a similar stratigraphy with Limestone beginning around elevation 595.0 ft. Boring 1 has a ground surface elevation of 615.80 ft and a depth of 25.8 ft. The upper 1.5 ft of the boring is Silty Clay, below the Silty Clay is a loose Clayey Silty Sand down to an elevation of 609.5 ft. From 609.5 ft. to 594.0 ft is a stiff to hard Sandy Clay Till. Boring 1 is terminated at 590.0 ft. in a 100+ blow count hard limey Clay.

Boring 2 has a ground surface elevation of 615.4 ft. and a depth of 24.4 ft. The first 8.9 ft. of the boring is a stiff Silty Sandy Clay. From 606.5 ft. to 595.2 ft. is alternating layers of hard Silty Clay Till and Sandy Clay Till. Boring 2 encountered broken Limestone at 595.2 ft. and is terminated at 591.0 ft. in Limestone.

Boring 3 has a ground surface elevation of 612.6 ft and a depth of 21.4 ft. The first 8.6 ft of the boring is a stiff to very stiff Silty Sandy Clay. From 604.0 ft. to 595.2 ft. is alternating layers of hard Silty Till and Sandy Clay Till. Boring 3 encountered gray Limestone at 595.2 ft and is terminated at 591.2 ft.

Boring 4 has a ground surface elevation of 611.2 ft and a depth of 19.2 ft. The upper 4.2 ft is a stiff to very stiff Silty Clay to Clay, below this layer is 1.5 ft of dense Sandy Silt. From 605.5 ft. to 596.0 ft. is a 6 ft. of hard Silty Till on top of 3.5 ft of very stiff Sandy Till. Boring 4 encountered hard gray Limestone at 596.0 ft and is terminated at 592.0 ft.

In August 2019 one additional boring, B-01, was taken ±84 ft. east of the proposed east abutment. Boring 01 (2019) has a ground surface elevation of 618.68 ft. and a depth of 33.5 ft. Soils were consistent with the 1958 borings above an elevation of ±594 to 596 ft. The 1958 borings reported no groundwater; the 2019 boring reported water at 605.7 ft., but dry upon completion. In Boring 01, under 7.5 ft. of Sandy Clay Loam Till fill and Silty Loam fill was stiff to hard Silty Clay, Silty Clay Loam, and Silty Clay Loam Till down to an elevation of 594.18 ft. The final 9.0 ft. reported in the boring, above an assumed Limestone surface at 585.18, is hard Gray Silt / Loam with carbonized Organics – very dense (borderline Shale). The final 9 ft. had blow counts above 34 and $Q_{us} > 4.5$ tsf.

Boring 1 (1958) is the closest to Boring 01 (2019) and reported 4 ft. of hard gray limey Clay above the end of boring at 590.0 ft. The other 3 1958 borings, further west, all reported broken Limestone or Limestone in the 4 ft. above the end of boring ±591 to 592 ft. There are no cores or pictures of the Limestone. The author feels the ± 6 to 7 foot difference in the top of assumed limestone in the 2019 boring and the 1958 end of boring elevations could partially be due to the different sampling methods used today. However due to the fact we do have 5 borings which indicate a limestone bedrock near the surface, the decision has been made to use 585.2 as the bedrock elevation for both abutments. Any variation in the elevation should be obvious when they drive the test pile.

Provide the location and maximum height of any new soil fill or magnitude of footing bearing pressure. Estimate the amount and time of the expected settlement. Indicate if further testing, analysis, and/or ground improvement/treatment is necessary: Any rise in the profile at the abutments is expected to be minimal. The existing embankment is over 60 years old, settlement should have already occurred. There is expected to be little or no settlement. When the BCR becomes available it will be reviewed to identify any existing settlement problems.

Identify any new cuts or fill slope angles and heights. Estimate the factor of safety against slope failure. Indicate if further testing, analysis or ground improvement/treatment is necessary: There are no cross sections this time, however with minimal grade change anticipated, fill slope angles will remain the same. The end slopes being only ±6 ft. tall and the very stiff to hard soils in the area will result in stable side slopes.

Indicate at each substructure, the 100-year and 200-year total scour depths in the Hydraulics report, the non-granular scour depth reduction, the proposed ground surface, and the recommended foundation design scour elevations: No scour was accounted for at the abutments per IDOT Policy. Spill through abutments shall be protected by riprap or slope wall in accordance to the Bridge Manual.

Event/Limit	Design Scour Elevations (ft.)		Item
	W. Abut	E. Abut.	
State			113
Q100	-	-	8
Q200	-	-	
Design	611.59	611.68	
Check	611.59	611.68	

Determining the seismic soil site class, the seismic performance zone, the 0.2 and 1.0 second design spectral accelerations and indicate if that the soils are liquefiable: This site has a seismic site class of "C", the seismic performance zone (SPZ)=1. The SDS= 0.128 g and an S_{D1} =0.073 g. Due to the S_{D1} being less than 0.15 g, a liquefaction analysis was not performed.

Confirm feasibility of the proposed foundation or wall type and provide design parameters. Attach a pile design table indicating feasible pile types, various nominal required bearings, factored resistances available and corresponding estimated lengths at locations where piles will be used. Provide factored bearing resistance and unit sliding resistance at various elevations and confirm no ground improvement/treatment is necessary where spread footings are proposed. Estimated top of rock elevations as well as preliminary factored unit side and tip resistance values shall be indicated when drilled shafts are proposed: Data from the four September 2019 Boring is more complete than the 1958 borings and is considered representative of the soils in the vicinity. Boring 01 was used to populate the data fields in the Estimated Pile Length spreadsheets.

Integral Abutment Feasibility (BBS 145) spreadsheets are also included. Information from both the 1958 and 2019 borings was used to populate the fields in the spreadsheet. Pre-cored shafts with a diameter of 24 inches, backfilled with bentonite, would allow for the required movement to use integral abutments at this location.

We recommend the use of H-piles. Due to the hard soils and shallow bedrock, we recommend coring to bedrock with the piles socketed in rock. One test pile is recommended at the west abutment. A table providing pile resistance and lengths for various recommended sizes is included in this report. This table was generated using no geotechnical losses associated with scour, liquification or consolidation. A full set of pile length spreadsheets for all the applicable sizes and wall thickness of metal shell piles are included in the appendix.

Assumptions used for the pile length analysis include:

- Bottom of West and East Abutment Elevations = 611.0 ft.
- The total factored loading for the abutments is 1920 kips.
- The pile cutoff allows for a 2 ft. embedment into the concrete for the abutments,
- No other geotechnical losses were accounted for in this analysis.
- Top of Limestone elevation = 585.18

Both Abutments, using Boring 01 (2019)			Both Abutments, using Boring 01 (2019)

476	262	26			
705	388	28			

Calculate the estimated water surface elevation and determine the need for cofferdams (type 1 or 2), and seal coat: The E.W.S.E. is 606.0 ft., no in stream work is anticipated during the construction of the abutments, therefore there is no need for a cofferdam.

Assess the need for sheeting or soil retention or temporary construction slope and provide recommendation for other construction concerns: At this time, we anticipate the structure to be built under staged construction conditions, therefore, Temporary Soil Retention will be required at the stage line. From the data Shown in the boring logs, driving sheet piling to the design embedment would not be possible: we recommend a Temporary Soil Retention System. The substructures shall be removed as per Section 501 of the 2016 IDOT Standard Specifications for Road And Bridge Construction.

Benchmark: BM 111: Chiseled "X" on top of the NE wingwall of SN 046-0032; Elev. 619.12; Sta. 966+33.28; offset 17.89 Lt.

Existing Structure: SN 046-0032 was originally constructed in 1959 as S.B.I. Route 17, Section 12-BR at Station 965+84.5. The existing 3-span reinforced concrete slab superstructure is supported by open pile bent abutments on steel H-piles and tapered solid wall piers on spread footings. The outer spans are 29'-0" and the middle span is 36'-6" with no skew. The back-to-back of abutments measure 98'-0" and the out-to-out width is 36'-4". The existing structure will be removed and replaced utilizing staged construction.

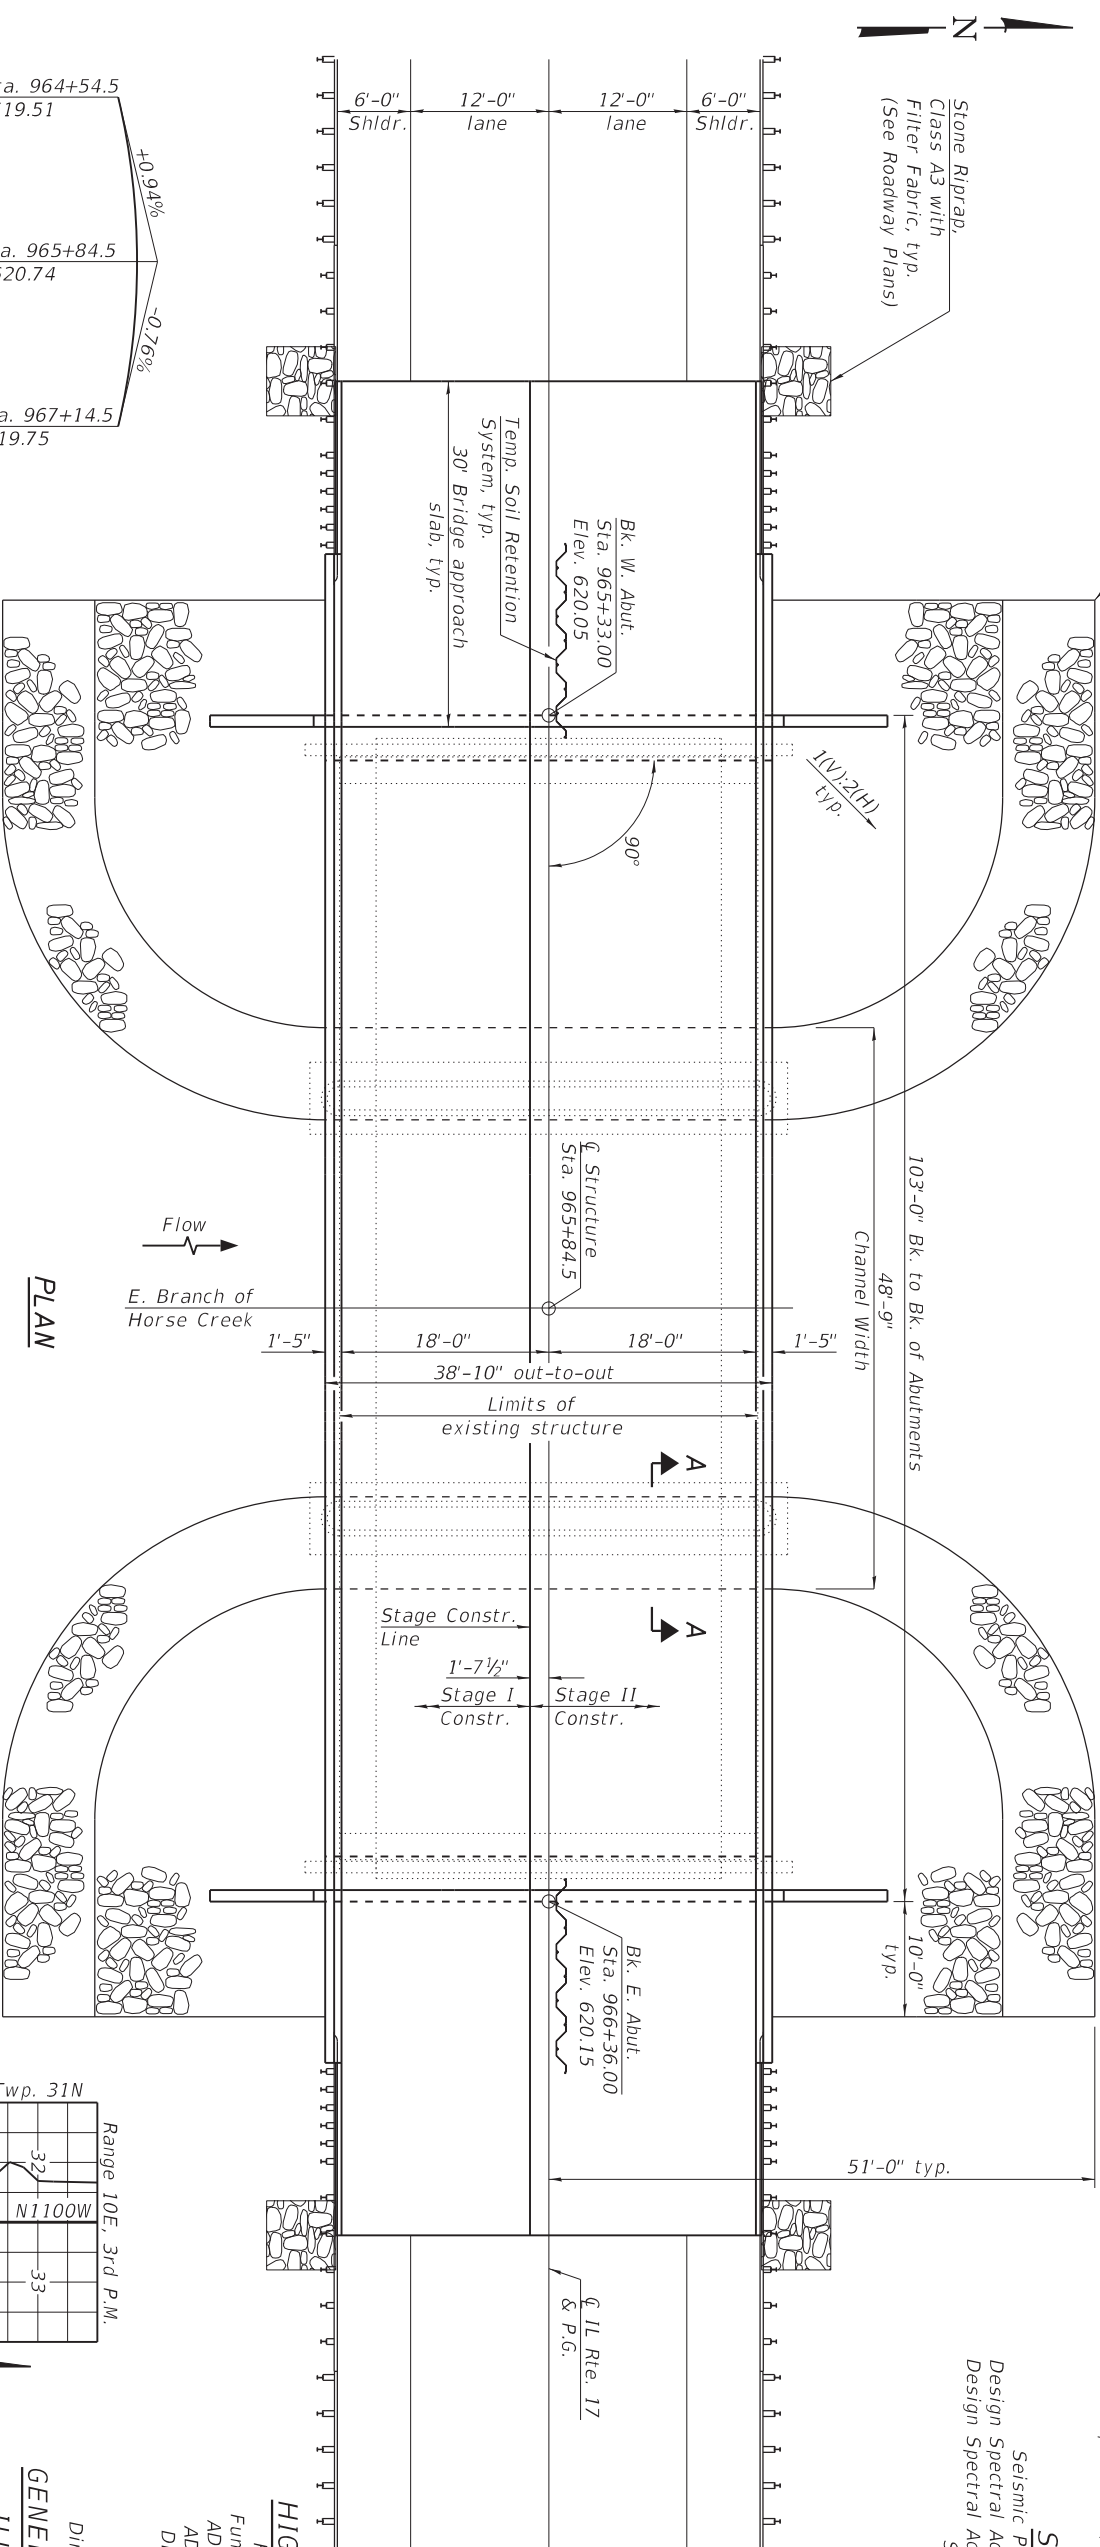

No salvage.

Very Stiff Gray Sandy Till	596.00	41	3.2	6.5	
Hard Gray Limestone	592.00	156			
End of Boring	-20				

SOIL BORING 046-0032.GPJ IL_DOT.GDT 10/31/19

The Unconfined Compressive Strength (UCS) Failure Mode is indicated by (B-Bulge, S-Shear, P-Penetrometer)
The SPT (N value) is the sum of the last two blow values in each sampling zone (AASHTO T206)

INTEGRAL ABUTMENT FEASIBILITY ANALYSIS
Modified 10/30/17

GENERAL DATA

STRUCTURE NUMBER=====046 0032 using 2019 boring data
 STRUCTURE TYPE =====SIMPLE-SPAN
 STRUCTURE SKEW=====0 DEGREES
 SUPER. DATA IN REFERENCE TO SUB. DATA ===== ABUT 2
 TOTAL STRUCTURE LENGTH===== 103.00 FT

SUPERSTRUCTURE DATA (END OR MAIN SPAN)	
BEAM TYPE	CONCRETE BEAM
CONCRETE BEAM	IL45-2438
BEAM F'C	8.5 KSI
BEAM SPACING PERP. TO CL	7.00 FT
SLAB THICKNESS	8.00 IN
SLAB F'C	4.00 KSI

SUPERSTRUCTURE DATA (ADJACENT SPAN)	
BEAM SPACING PERP. TO CL	FT

ABUTMENT #1 DATA	
ABUTMENT NAME	East
ABUTMENT REFERENCE BORING	Boring 01 (2019)
BOTTOM OF ABUTMENT ELEVATION	611 FT
ESTIMATED NUMBER OF PILES AT ABUT.	6
PILE SPACING PERP. TO CL	7 FT

ABUTMENT #2 DATA	
ABUTMENT NAME	West
ABUTMENT REFERENCE BORING	Boring 2(1958)
BOTTOM OF ABUTMENT ELEVATION	611 FT
ESTIMATED NUMBER OF PILES AT ABUT.	6
PILE SPACING PERP. TO CL	7 FT

SOIL DATA FOR 10 FT BENEATH BOTTOM OF ABUTMENT #1				
BOT. OF LAYER ELEV. (FT)	LAYER THICKNESS (FT)	UNCONFINED COMPRESSIVE STRENGTH (TSF)	N S.P.T. VALUE (BLOWS/12 IN.)	Qu EQUIV. FOR N VALUE (TSF)
606.18	4.82	1.8		
604.18	2.00	2.0		
601.00	3.18	5.2		

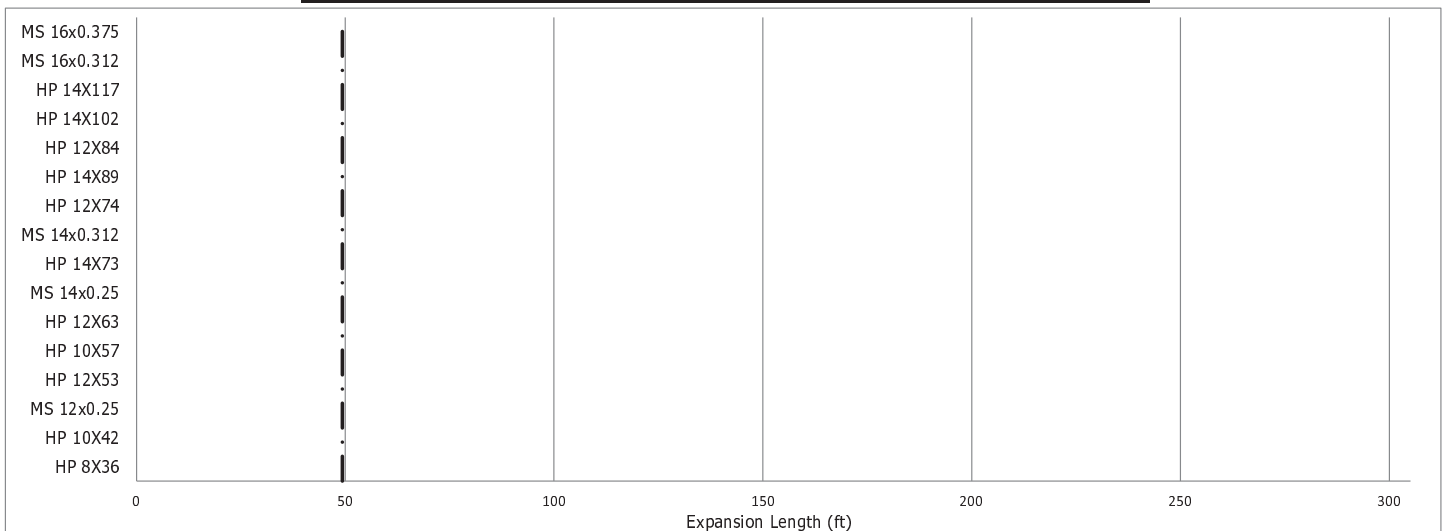

SOIL DATA FOR 10 FT BENEATH BOTTOM OF ABUTMENT #2				
BOT. OF LAYER ELEV. (FT)	LAYER THICKNESS (FT)	UNCONFINED COMPRESSIVE STRENGTH (TSF)	N S.P.T. VALUE (BLOWS/12 IN.)	Qu EQUIV. FOR N VALUE (TSF)
606.50	4.50	1.5		
603.50	3.00	4.1		
601.00	2.50	4.7		

10.00 FT = TOTAL DEPTH ENTERED

10.00 FT = TOTAL DEPTH ENTERED

WEIGHTED AVERAGE Qu FOR ABUTMENT #1===== 2.92 TSF
 PILE STIFFNESS MODIFIER FOR ABUTMENT #1 = 1/(1.45-[0.3*2.92])===== 1.74
 WEIGHTED AVERAGE Qu FOR ABUTMENT #2===== 3.08 TSF
 PILE STIFFNESS MODIFIER FOR ABUTMENT #2 = 1/(1.45-[0.3*3.08])===== 1.90
WEIGHTED AVG. Qu > 3.0 TSF WITH TRIB. LENGTH > 20%, INTEGRAL ABUTMENT STRUCTURE NOT ALLOWED
 DISTANCE TO CENTROID OF STIFFNESS FROM ABUTMENT #1 = [1.74*6*0+1.9*6*103]/[1.74*6+1.9*6]===== 53.73 FT
 DISTANCE TO CENTROID OF STIFFNESS FROM ABUTMENT #2 = [1.9*6*0+1.74*6*103]/[1.9*6+1.74*6]===== 49.27 FT

ABUT 2 (West) - EXPANSION LENGTH LIMIT CHART - 0 DEG. SKEW

----- = Estimated expansion length for the indicated abutment. Piles with an expansion length greater than this are suitable for consideration
 (Note: The same size pile should be used at both abutments.)
