## **Project Description and Scope**

This project involves the complete replacement of dual bridges carrying I-24 over Bear Creek in Massac County. The project site is located in Section 22, Range 4E, Township 14S, in the 3<sup>rd</sup> Principal Meridian. A *Location Map* is presented in Exhibit A.

There are existing dual bridges at this location, SN 064-0017 and SN 064-0018, which were constructed in 1971. They are three span structures with rolled steel beam superstructures supported on concrete wall piers and stub abutments. The abutments are supported on concrete piles. The existing plans call for concrete piles driven to 35 Ton or 44 Ton capacity with estimated lengths of 55 to 59 feet at all four abutments. The piers utilize spread footings on untreated timber piles. The existing plans call for timber piles driven to 20 Ton capacity with estimated lengths of 44 to 47 feet at all four piers. Concrete slope walls are present from top to toe of slopes of both bridges. Both bridges measure 150'-10" back to back abutments and are 42'-0" out to out, with a 43° right ahead skew.

Per the preliminary Type, Size & Location Plan (TSL), the proposed dual structures are three span bridges with W30 rolled beams supported on integral abutments and pile bent piers with encasement wall. The proposed WB and EB structures will have back-to-back abutment lengths of 151'-0" and out-to-out widths of 44'-10", with a 43° right ahead skew. The roadway will be on vertical and horizontal tangent alignments. The proposed abutments will be constructed on existing embankments in roughly the same location as the existing abutments. The proposed profiles will be within a few inches of the existing profiles for both structures. Traffic will be maintained utilizing crossovers during construction. The new structures are to be designed following LRFD Bridge Design Specifications.

See *Preliminary TSL* attached in Exhibit B for further information about the proposed structures.

## **Field Exploration**

### **Subsurface Exploration and Testing**

The site is located about 1 mile south/southeast of the I-24/ Big Bay Road interchange surrounded by farmland outside the IDOT Right of Way, except for a wooded area just southwest of the bridges. The structures cross over Bear Creek, with a channel measuring between 15' to 22'. A grassy median separates the two structures. There are no utilities located near the structures.

The subsurface investigation consisted of two borings (1-S and 3-S) drilled by IDOT District 9 personnel in October of 2018. Additionally, four borings (1S thru 4S) from the original construction plans dated September 1968 were used to supplement the newer borings. 1-S was drilled between the east abutments, nearer to the EB structure; 3-S was drilled between the west abutments, nearer to the EB structure. The 1968 borings are located at the EB West Abutment (1S), the WB West Abutment (2S), the WB East Abutment (3S) and the EB Pier 2 (4S). Boring locations can be found in Exhibit B.

For the 2018 borings, standard penetration tests (SPT) were conducted every 2.5 feet below the ground surface according to AASHTO T 206, using a Hollow Stem Auger. The 2018 borings were drilled to depths exceeding 70 feet. No rock layers were encountered within the limits of the borings.

## **Subsurface Conditions**

While drilling the 2018 borings, no free water was observed prior to beginning mud drilling around elevation 322. For the 1968 borings taken prior to the original construction, the groundwater level was observed at elevation 336.

The two borings taken in 2018 (1-S and 3-S) both encountered similar soil layers, with medium stiff to very stiff clay to silty clay layers starting at the ground surface and continuing to approximate elevation 322. Below this elevation is loose sand with clay layers followed by layers of dense sand. The four borings from 1968 (1S thru 4S) are very consistent with the newer borings.

Further descriptions of the soil conditions encountered in the borings are presented in the *Soil Borings* attached in Exhibit D and the *Subsurface Data Profile* in Exhibit C.

## **Geotechnical Evaluations**

### **Settlement**

Per the preliminary TSL, the proposed profiles will be within a few inches the existing. The proposed abutments will be located in roughly the same place as the existing abutments on existing embankments, resulting in calculated settlement of less than 0.4 inches. Since the settlement is negligible, downdrag forces are not significant and no pre-coring will be required.

### **Slope Stability**

Preliminary stability analyses using Bishop's method were performed for both abutments on SN 064-0047 and SN 064-0048. According to AASHTO LRFD 11.6.2.3, the required resistance factor for slope stability is 0.65 which is equivalent to factor of safety of 1.54. The slope stability models rendered a worst-case factor of safety of 1.97. As per AASHTO LRFD 11.6.5.3, minimum required factor of safety under the effect of seismic loads is 1. The seismic slope stability yielded a worst-case factor of safety of 1.29. The horizontal coefficient was calculated according to FHWA-NHI-11-032. The horizontal coefficient for the west and east abutments is 0.26g. Slope stability analyses are presented in Exhibit G. No stability problems are expected.

### **Seismic Considerations**

Based on the method described in the IDOT Design Guide LRFD Soil Site Class Definition, Soil Site Class E controls. The Design Spectral Acceleration at 1.0 sec ( $S_{D1}$ ) is 0.783g and at 0.2 sec ( $S_{D2}$ ) is 0.959g. These values are based on a 1000-year design return period earthquake. According to AASHTO LRFD 3.10.6 the Seismic Performance Zone is 4 based on the 1.0 second Design Spectral Acceleration.

Liquefaction analysis was performed using the IDOT Liquefaction Analysis spreadsheet for each boring at the proposed bridge locations. All boring locations were found to contain potentially liquefiable layers. Effects of liquefaction should be accounted for at all substructure locations. Liquefaction calculations are presented in Exhibit E.

## Scour

With integral abutments protected by riprap, the design scour elevation is set at the bottom of the abutment cap per IDOT Bridge Manual 2.3.6.3.2. See table 1 for Scour Elevation Table.

Event/Limit State	Design Scour Elevations (ft)

Table 1

## Foundation Recommendations

Following is the summary of preliminary factored vertical loads for the AASHTO LRFD Strength I load combination provided by ESCA Consultants, Inc., for both bridges. The Extreme Event I load combination was estimated to be 75% of Strength I.

### Strength I Load Combination

Abutments	880 kips
Piers	1540 kips

### Abutments

Due to IDOT's strong desire for a jointless structure, integral abutments will be provided for both of these bridges. Per IDOT ABD Memoranda 19.8, all pile types are permissible for an effective expansion length of 76.5' determined for westbound SN 064-0047, or for an effective expansion length of 80.3' determined for eastbound SN 064-0048. Unless the abutment type is changed, spread footings and drilled shafts are not allowed for integral abutments as per the IDOT Bridge Manual.

Driven pile foundation design includes seismic design, which accounts for the effects of liquefiable soil layers at each abutment. Analyses have been performed using the Modified IDOT Static Method for estimating nominal pile resistance. Pile size calculations are presented in Exhibit F and summarized in Tables 2 thru 9. The estimated lengths include a 2-foot embedment into the abutment cap and are based on top of pile elevations of 343.65 at the west abutment and 343.76 at the east abutment for SN 064-0047, and 343.73 at the west abutment and 343.88 at the east abutment for SN 064-0048.  $R_n$  values in tables represent the nominal required bearing. Due to the soil type and presence of liquefiable soils, the HP sections are not able to develop enough capacity as friction piles, therefore only metal shell piles are presented in the tables.

Table 9 (Continued)

## Piers

There are multiple options for the type of foundation at the piers: Spread footing bearing on soil, pile-supported foundation, or drilled shaft foundation.

*Spread Footing on Soil:* Due to the weaker soil layers with an unconfined compressive strength less than 2.0 tsf at the elevation of the pier footings, it is not recommended to utilize spread footings.

*Pile Supported:* Using a pile bent pier with a single line of piles is appropriate for the bridge size and type. Analyses have been performed using the Modified IDOT Static Method for estimating nominal pile resistance. Pile size calculations are presented in Exhibit F and summarized in Tables 10 thru 17. The estimated lengths include a 1-foot embedment into the pier cap and are based on top of pile elevations of 344.33 at Pier 1 and 344.38 and Pier 2 for SN 064-0047, and 344.42 at Pier 1 and 344.48 at Pier 2 for SN 064-0048. R<sub>n</sub> values in tables represent the nominal required bearing. Due to the soil type and presence of liquefiable soils, the HP sections are not able to develop enough capacity as friction piles, therefore only metal shell piles are presented in the tables.

*Drilled Shafts:* With no rock layers indicated at the borings, drilled shafts would be uneconomical at this location.

Table 17 (Continued)

## Lateral Loading Analysis

Tables 18 thru 25 provide soil parameters for the LPile program (or other approved programs) for the structural engineer to perform the lateral analysis of the foundations.

Per Bridge Manual 3.10.1.10, if the lateral load on a pile exceeds 3 kips then a detailed soil structure interaction analysis shall be performed.

Soil Type	Elev. At Bottom of Layer	Effective Unit Wt. (pci)	Friction Angle (deg)	k (pci)	c (psi)	E50
Stiff Clay	321.5	0.034	-	500	7.0	0.007
Loose Sand	316.5	0.030	27.7	20	-	-
Soft Clay	311.5	0.027	-	30	2.1	0.020
Medium Sand	309.0	0.040	34.9	60	-	-
Dense to Loose Sand	291.5	0.037	33.0	60	-	-
Medium Sand	284.0	0.039	34.4	60	-	-

## **Construction Considerations**

### **Stage Construction**

Traffic is expected to be maintained on I-24 utilizing cross overs for the construction of both structures. No temporary soil support system will be required for construction, as each of the proposed bridges will be constructed in a single stage and there is adequate space between the structures to excavate without cutting into the other structure. It has been determined that the soil will generally be adequate for a 1V:1H excavation slope. However, if the intermittent soft soil layers shown in the borings are encountered in the field, a 1V:1.5H excavation slope may be more appropriate.

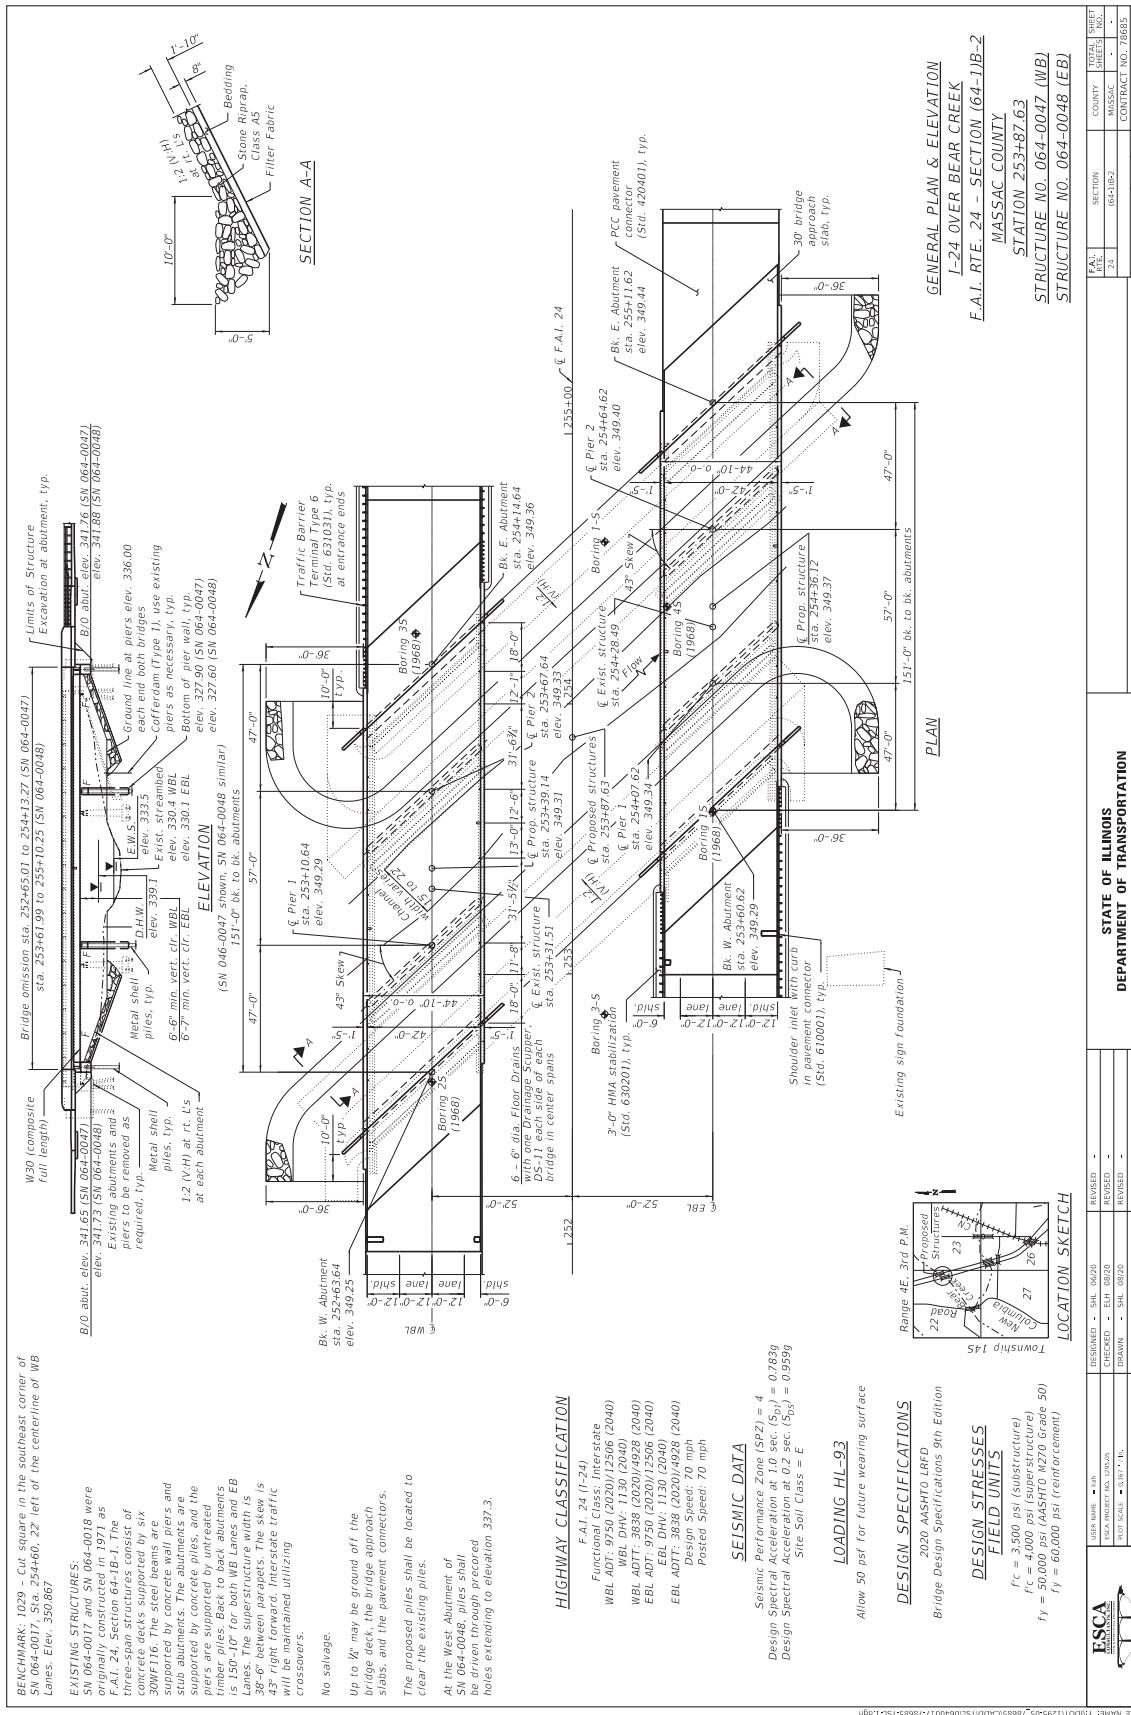

### **Foundation Construction**

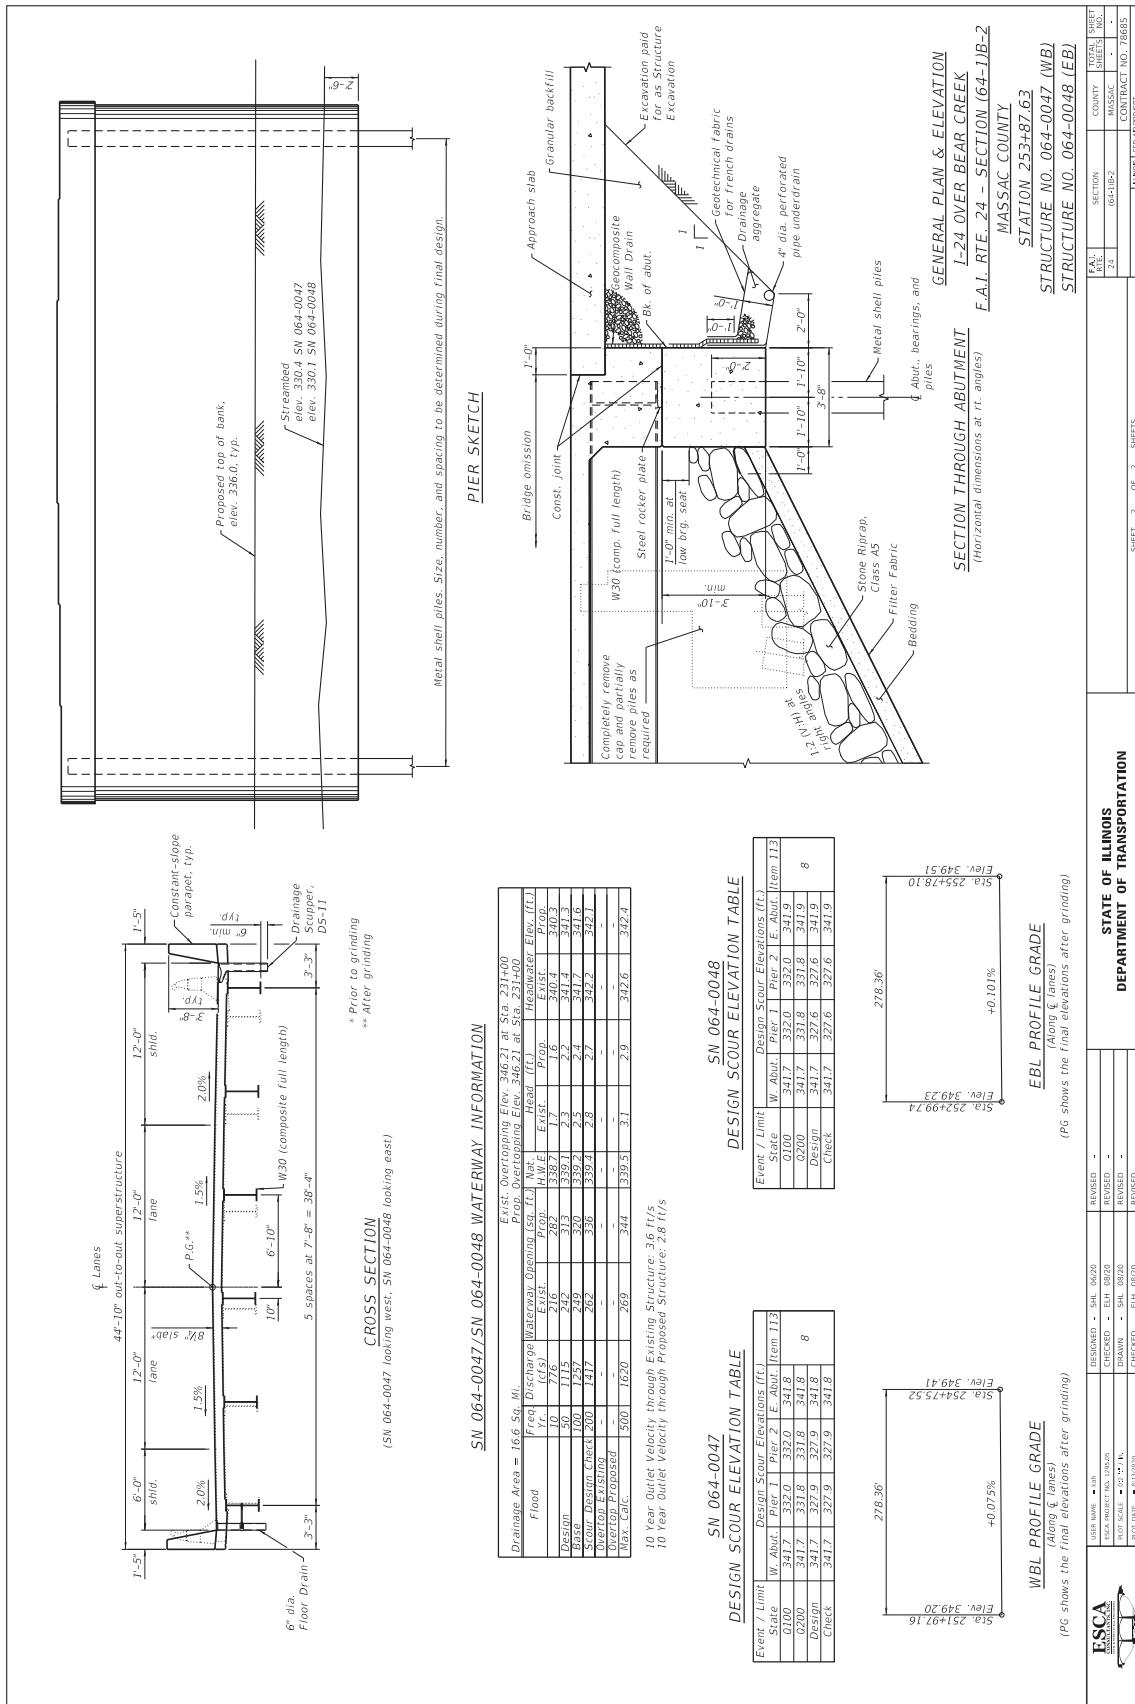

One test pile at each driven pile foundation should be provided due to the inconsistencies in the soil layers between the borings. Pile shoes are not required due to the absence of rock layers.

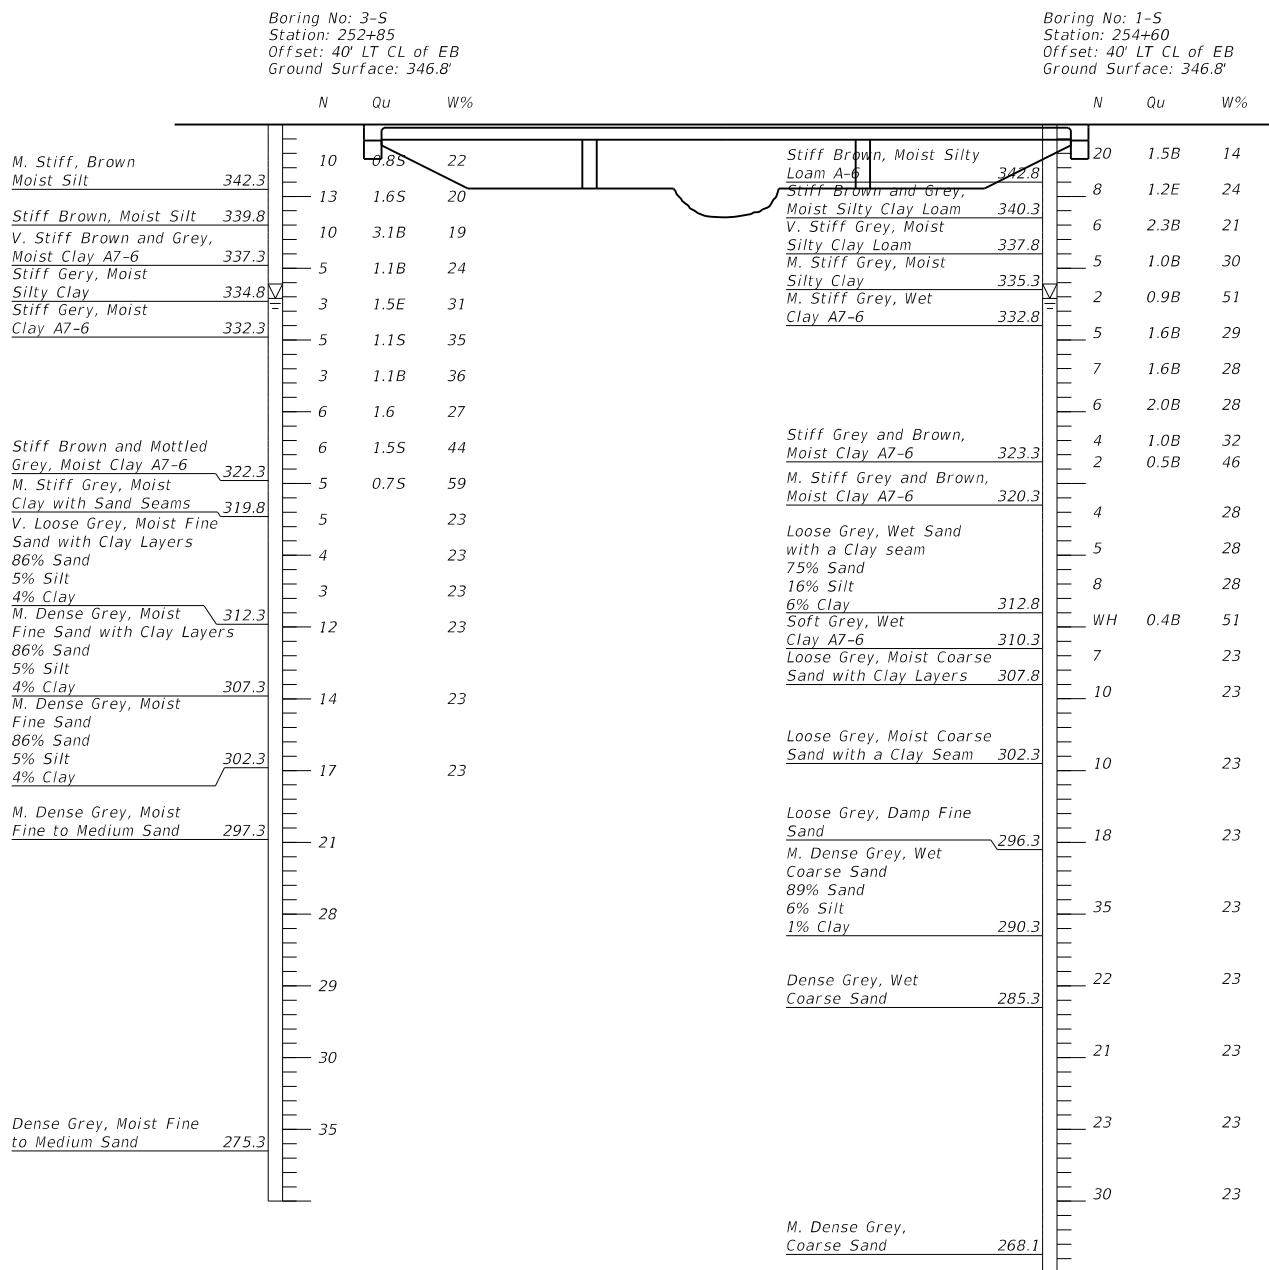

### **Limitations**

The recommendations provided herein are for the exclusive use of IDOT and ESCA Consultants, Inc. They are specific only to the project described, and are based on subsurface information obtained at boring locations within the bridge area, our understanding of the project as described herein, and geotechnical engineering practice consistent with the standard of care. No other warranty is expressed or implied. Lin Engineering, Ltd. should be contacted if conditions encountered during construction are not consistent with those described.

### Memorandum

---

To: Carrie Nelsen Attn: Dave Piche  
From: Keith Roberts By: Aaron Hayes (R6)  
Subject: Boring Logs AWH  
Date: December 20, 2018

---

**FAI-24 over Bear Creek  
Structures 064-0017 & -0018 (Existing)  
Section (64-1)B-2  
Massac County**

Foundation boring logs have been obtained for the above listed structures and are attached.

Boring 1-S, near the east abutments, shows a layer of potentially liquefiable soil from a depth of 26.5 to 50.5 feet. Boring 3-S, near the west abutments, shows a layer of potentially liquefiable soil from a depth of 27.0 to 49.5 feet. A liquefaction analysis should be completed once the proposed structures' dimensions are determined. Boring 2-S was a test boring located near 1-S and has not been included in this report.

The old borings completed for the existing structures built in 1971 are also attached.

IDOT STATIC METHOD OF ESTIMATING PILE LENGTH

SUBSTRUCTURE===== 064-0047 (WB) W Abutment  
REFERENCE BORING ===== 2S

LRFD or ASD SEISMIC ===== SEISMIC  
PILE CUTOFF ELEV. ===== 343.65 ft  
GROUND SURFACE ELEV. AGAINST PILE DURING DRIVING = 341.65 ft  
GEOTECHNICAL LOSS TYPE (None Scour Liquef., DD) =====  
Liquef.  
BOTTOM ELEV. OF SCOUR, LIQUEF., OR DD ===== 266.00 ft  
TOP ELEV. OF LIQUEF. (so layers above apply DD) ===== 324.00 ft

TOTAL SEISMIC SUBSTRUCTURE LOAD ===== 660 kips  
TOTAL LENGTH OF SUBSTRUCTURE (along skew)===== 61.30 ft  
NUMBER OF ROWS OF PILES PER SUBSTRUCTURE ===== 1

Approx. Seismic Loading Applied per pile spaced at 8 ft. Cts ===== 86.13 KIPS  
Approx. Seismic Loading Applied per pile spaced at 3 ft. Cts ===== 32.30 KIPS

PILE TYPE AND SIZE ===== Metal Shell 16"Φ w/.375" walls

Plugged Pile Perimeter===== 4.189 FT.  
Plugged Pile End Bearing Area===== 1.396 SQFT.

**MAX. REQUIRED BEARING & RESISTANCE for Selected Pile, Soil Profile, & Losses**

Maximum Nominal Req'd Bearing of Pile	Maximum Nominal Req'd Bearing of Boring	Maximum Seismic Resistance Available in Boring	Maximum Pile Driveable Length in Boring

IDOT STATIC METHOD OF ESTIMATING PILE LENGTH

SUBSTRUCTURE===== 064-0048 (EB) Pier 1  
REFERENCE BORING ===== 4S

LRFD or ASD SEISMIC ===== LRF  
PILE CUTOFF ELEV. ===== 344.42 ft  
GROUND SURFACE ELEV. AGAINST PILE DURING DRIVING = 327.60 ft  
GEOTECHNICAL LOSS TYPE (None Scour Liquef., DD) ===== Scour  
BOTTOM ELEV. OF SCOUR, LIQUEF., OR DD ===== 327.60 ft  
TOP ELEV. OF LIQUEF. (so layers above apply DD) ===== ft

TOTAL FACTORED SUBSTRUCTURE LOAD ===== 1540 kips  
TOTAL LENGTH OF SUBSTRUCTURE (along skew)===== 61.30 ft  
NUMBER OF ROWS OF PILES PER SUBSTRUCTURE ===== 1

Approx. Factored Loading Applied per pile at 8 ft. Cts ===== 200.97 KIPS  
Approx. Factored Loading Applied per pile at 3 ft. Cts ===== 75.37 KIPS

PILE TYPE AND SIZE ===== Metal Shell 16"Φ w/.375" walls  
Plugged Pile Perimeter===== 4.189 FT.  
Plugged Pile End Bearing Area===== 1.396 SQFT.

**MAX. REQUIRED BEARING & RESISTANCE for Selected Pile, Soil Profile, & Losses**

Maximum Nominal Req'd Bearing of Pile	Maximum Nominal Req'd Bearing of Boring	Maximum Factored Resistance Available in Boring	Maximum Pile Driveable Length in Boring
782 KIPS	780 KIPS	429 KIPS	100 FT.

IDOT STATIC METHOD OF ESTIMATING PILE LENGTH

SUBSTRUCTURE===== 064-0048 (EB) Pier 2  
 REFERENCE BORING ===== 4S  
 LRFD or ASD SEISMIC ===== SEISMIC  
 PILE CUTOFF ELEV. ===== 344.48 ft  
 GROUND SURFACE ELEV. AGAINST PILE DURING DRIVING = 327.60 ft  
 GEOTECHNICAL LOSS TYPE (None Scour, Liquef., DD) ===== Liquef.  
 BOTTOM ELEV. OF SCOUR, LIQUEF., or DD ===== 270.60 ft  
 TOP ELEV. OF LIQUEF. (so layers above apply DD) ===== 318.10 ft

TOTAL SEISMIC SUBSTRUCTURE LOAD ===== 1155 kips  
 TOTAL LENGTH OF SUBSTRUCTURE (along skew)===== 61.30 ft  
 NUMBER OF ROWS OF PILES PER SUBSTRUCTURE ===== 1  
 Approx. Seismic Loading Applied per pile spaced at 8 ft. Cts ===== 150.73 KIPS  
 Approx. Seismic Loading Applied per pile spaced at 3 ft. Cts ===== 56.52 KIPS

PILE TYPE AND SIZE ===== Metal Shell 16"Φ w/.375" walls  
 Plugged Pile Perimeter===== 4.189 FT.  
 Plugged Pile End Bearing Area===== 1.396 SQFT.

Maximum Nominal Req'd Bearing of Pile	Maximum Nominal Req'd Bearing of Boring	Maximum Seismic Resistance Available in Boring	Maximum Pile Driveable Length in Boring
782 KIPS	780 KIPS	419 KIPS	100 FT.

BOT. OF LAYER ELEV. (FT.)	LAYER THICK. (TSF.)	UNCONF. COMPR. STRENGTH	S.P.T. N VALUE (BLOWS)	GRANULAR OR ROCK LAYER DESCRIPTION	ULTIMATE PLUGGED			NOMINAL REQ'D BEARING (KIPS)	NOMINAL GEOTECH. LOSS FROM LIQUEF. & DD (KIPS)	FACTORIED GEOTECH. LOSS LOAD FROM DD (KIPS)	SEISMIC RESISTANCE AVAILABLE (KIPS)	ESTIMATED PILE LENGTH (FT.)
					SIDE RESIST. (KIPS)	END BRG. RESIST. (KIPS)	TOTAL RESIST. (KIPS)
