Date: August 13, 2024

1. Introduction

This final design report presents design concepts for mitigation of slope instability at the twin structures carrying IL-13 over the Big Muddy River in Murphysboro, Illinois. Instability has primarily impacted the west embankment of the eastbound (EB) bridge, but mitigation is recommended for both sides of the river to protect both EB and westbound (WB) structures. The report begins with a brief history of instability at the site before documenting available information from the site to support a discussion of the observed instability. After discussing the instability, the recommended mitigation concept is presented.

The mitigation concept consists of driving closely spaced large-diameter, open-end pipe piles on both sides of the river and continued monitoring of piezometers and inclinometers to verify the effectiveness of the pipe pile stabilization. The report begins with a summary of the most important findings and recommendations. The rest of the report presents information regarding historical instability and subsurface conditions, describes analyses used to develop the design recommendations, and closes with recommendations regarding pile driving, stability during construction, and instrumentation and monitoring.

2. Summary of Findings and Recommendations

The most important findings and recommendations from this report are:

1. Results of extensive groundwater monitoring indicate piezometric elevations within the loam to be 15 ft above the river (i.e. just above the bank elevation) for normal river levels. In addition, piezometric elevations within the west embankment were observed to be as much as 25 ft above the river level. The high piezometric elevations, particularly those within the west embankment, are the primary driver of observed instability on the west side of the river. The source of the elevated piezometric elevations is unknown.
2. Characterization of the loam shear strength using the results of extensive lab testing produced a slope stability model that accurately predicts a marginal factor of safety for existing conditions. The model is based on observed groundwater conditions. Back-calculation of the slope stability corroborates the shear strength measured in the laboratory.

3. To achieve a factor of safety of 1.5, 60-inch diameter by 0.5-inch thick wall (min.) open-ended pipe piles should be driven to bedrock on 10-ft center-to-center spacing. The steel should be Grade 50 or better. Two rows of piles are required for the west bank, with the piles staggered between the two rows. One row is required for the east bank. The piles should be driven from the bank in front of the abutments, with the lines of piles extending approximately 75 ft beyond the edges of the structures. The engineer's cost estimate for the piles, which includes only costs associated with steel piling and installation, is approximately \$2.5M.
4. The piles should be advanced through the sand layer and seated on bedrock. There is no requirement to demonstrate axial resistance during driving and driving should cease upon reaching practical refusal. Preliminary driveability analysis using an assumed hammer indicates the piles can be advanced to bedrock without overstressing and without meeting practical refusal using a commonly available hammer. Specifically, a Delmag D46 was included in the analysis, but other hammers would likely work. The pile driving contractor should perform an independent driveability analysis. Note that the driving stress should be limited to $0.9f_y$ which equates to 45 ksi for Grade 50 steel.
5. It may be necessary and advantageous to advance the piles using a vibratory hammer, at least initially. Vibratory methods may be associated with greater risk of movement of existing piers than impact driving. Plan notes and specifications should therefore be developed to mitigate the risk of ground loss associated with vibratory methods.
6. Piles should be installed using methods that reduce the risk of instability during construction. These include the use of robust crane mats as well as staging construction equipment and scheduling installation operations to reduce instability.
7. Monitoring of existing piezometers and inclinometers should continue on a monthly basis until at least one year after installation of the piles. The monitoring program should also include surveys of the existing structures and instrumentation of select piles. It may be advantageous to increase the frequency of monitoring during pile installation to mitigate the risk of instability due to construction operations.

3. Brief Site History and Summary of Observed Sliding

Originally, IL-13 crossed the Big Muddy on a single structure that was constructed circa 1955 on the same alignment as the current EB bridge. A separate structure for the WB bridge was added in the late 1970s just north of the original bridge, which was left in service to carry EB traffic. Both structures were replaced circa 2015. Below the embankments, soils at the site consist of approximately 50 ft of loam over approximately 20 ft of sand over coal and shale.

Reported stability problems with the EB bridge embankment date back to the original structure. A 1969 IDOT design report supporting the eventual 1970s expansion of IL-13 noted “some stability problems have occurred in the past on the abutments of the existing Big Muddy structure; therefore this area may require some special attention during its design.” The soils report for the 1970s expansion notes “excessive settlement of the existing pavement has occurred in the past for this area, which may require special attention in the design of the proposed improvement.” The soils report proceeded to recommend sand drains to expedite settlement of the WB embankment. The WB embankment was, in fact, constructed with sand drains, as well as piezometers and settlement plates to monitor settlement.

In the 1980s, the original (EB) structure was rehabilitated. Settlement and rotation toward the river was noted but attributed to abutment settlement. A 2005 slope stability analysis by District 9

indicated a factor of safety of 1.27 for a deep sliding surface passing through the embankment and the underlying loam. The 2010 SGR for the replacement (and current) structures suggested setbacks for the abutments as a settlement mitigation technique. The current structures do utilize setbacks, with the abutments approximately 50 ft behind the original locations. In addition, the abutments were anchored.

Despite the setbacks and anchoring, instability of the EB embankment has persisted. By winter of 2022-2023, a void had formed beneath the west abutment of the EB structure, and Pier 4 (the pier closest to the west abutment) had displaced laterally between 4 and 5 inches. Corresponding displacement of the beams sheared the bolts connecting the beams to Pier 4. In response, IDOT installed a new pier founded on drilled shafts just east of Pier 4.

In 2022, IDOT installed four inclinometers (H-1 through H-4) and a piezometer (H-2) as shown in Figure 1. The interpreted sliding surface by IDOT is shown in Figure 2. The interpretation is based on observed movement in inclinometers H-1 and H-2, as well as observed pavement distress behind the abutment. As shown in Figure 3(a), inclinometer H-1 indicated deep sliding at the base of the loam, just atop the medium dense sand. This corresponds to a very weak zone observed in CPT-01, a cone penetration test (CPT) sounding that was pushed next to H-1 (Figure 3(b)). The weak zone is likely indicative of low strengths associated with an existing slide plane (i.e., residual shear strength).

Although a potential sliding plane was identified at El. 324 in inclinometer H-2, the magnitude of observed displacement in H-2 is only 0.01 inch from El. 324 to approximately El. 360. The maximum observed displacement at the ground surface, approximately El. 373, is less than 0.1 inch. As shown in Figure 1, inclinometer H-3 is just north of the WB bridge along the access road beneath the bridge. Approximately 2.8 inches displacement has been observed in the top 10 ft of H-3, with movement occurring in a direction approximately 30 deg. toward the A+ direction from the direction of B+ (Figure 1). Inclinometer H-4 was installed on the east side of the river. No significant displacement has been observed in H-4.

4. Previous Reports and Investigations

At least three previous geotechnical reports have been prepared for the project site:

1. The Soils Report supporting the 1970s expansion of IL-13 to include the WB embankment. As mentioned above, the 1970s report recommended sand drains beneath the WB embankment to accelerate consolidation settlement, which was predicted to last more than 20 years without drains. The 12-inch diameter sand drains were spaced at 5 ft on center, installed by jetting, and tie into a sand blanket at the ground surface. The report calls for the drains to extend to El. 338, or about midway through the loam layer (i.e., not into the underlying sand). The report indicated

adequate stability of the WB embankment, with stability factors of safety of 1.5 and greater for the Big Muddy area. The report includes logs of 11 borings. Seven borings were intended to support embankment design and include unconsolidated-undrained triaxial tests and consolidation tests; the remaining four borings are for bridge foundations.

2. The 2010 SGR by SCI Engineering, Inc. supporting the replacement of the original bridges with the existing structures. The report includes results from nine borings, six completed by IDOT in 2004 and three by SCI in 2009. The report noted portions of the existing embankment side slopes are “severely eroded.” The report documents slope stability analysis with factors of safety of 1.4 and 1.8 for short-term and long-term stability, respectively. As noted in the previous section, the SGR presented various techniques for mitigating potential settlement, including the option of abutment setbacks that was ultimately adopted.
3. A report by GSG Consultants, Inc. dated September 27, 2023 with slope stabilization alternatives. The report was prepared in response to the advanced distress observed in 2022 and 2023 and described in the previous section. The report primarily documents a series of slope stability analyses that were performed to evaluate existing conditions and structural remediation alternatives. The report attributes the observed instability to rapid drawdown, a phenomenon in which sudden lowering of a reservoir removes the stabilizing effect of ponded water before elevated pore pressures within slope soils have time to drain. Remediation options analyzed for the report include stabilization by drilled shafts, micropiles, deep soil mixing, and soldier pile walls as well as an option involving modified geometry.

5. Subsurface Investigation from 2024

Dan Brown and Associates (DBA) recommended an additional subsurface investigation be completed in 2024, primarily to collect additional information regarding groundwater conditions. The emphasis on groundwater conditions was based on the piezometric pressures observed in H-2, which indicated piezometric pressure within the deep sand layer that was consistently at least 10 ft above the river level. It is noted the elevated piezometric conditions in H-2 were the basis for the rapid drawdown analysis in the GSG report.

The 2024 investigation was managed by Millennia Professional Services. Results of the investigation are presented in a Geotechnical Data Report (GDR) by Millennia dated August 9, 2024. As shown in Figure 4 (west side of river) and Figure 5 (east side of river), the investigation includes five new borings and ten new CPT soundings. Upon completion of drilling each boring, an inclinometer casing with three vibrating wire piezometer sensors was grouted in the borehole. The sensors are used to measure pore water pressure at three depths, generally targeting the deep sand layer, a depth near the bottom of the loam, and a depth near the top of the loam.

For each CPT, piezometric elevations were measured at discrete locations via excess pore pressure dissipation tests. During the dissipation tests, the CPT probe was held at a constant elevation until the pore pressure sensor at the tip of the probe indicated pore pressures had reached a steady condition or until four hours had passed, whichever occurred first. Three depths for dissipation testing were targeted along each CPT sounding, with at least one test in the sand and one in the loam. All CPT dissipation tests in sand achieved equilibrium prior to four hours; most of the tests in loam also achieved equilibrium but four did not.

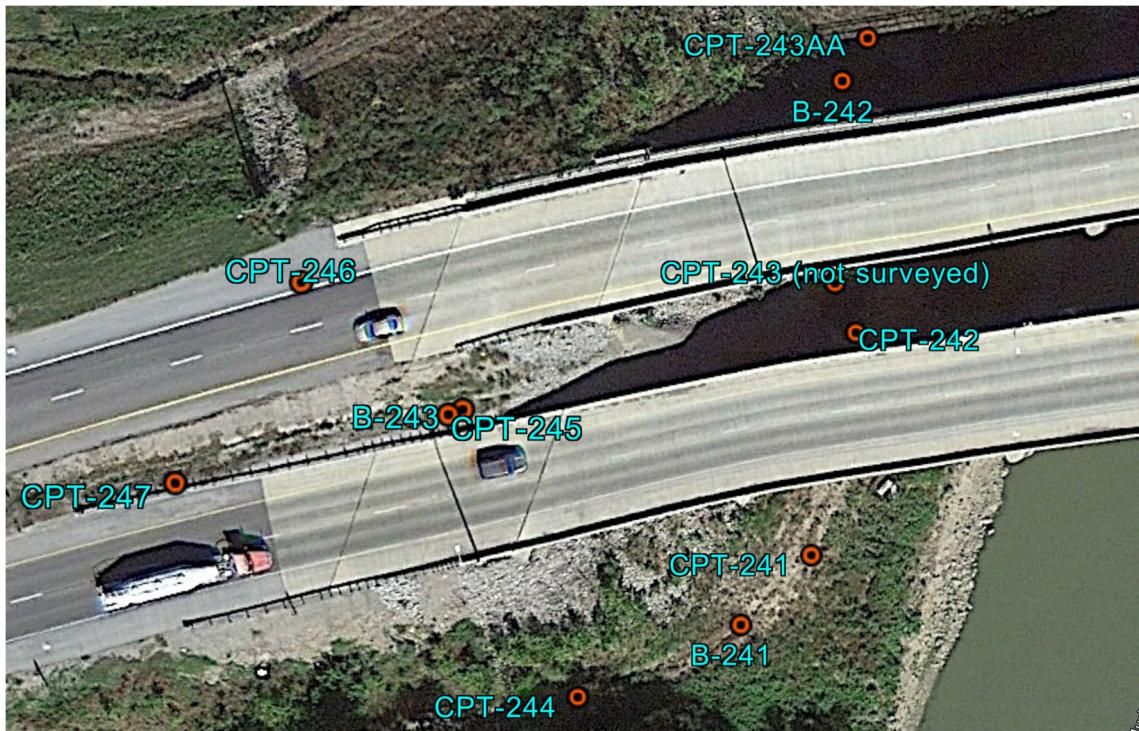

Figure 4: Boring and CPT locations for the 2024 subsurface investigation on the west side of the river.

Figure 5: Boring and CPT locations for the 2024 subsurface investigation on the east side of the river.

A series of laboratory tests was performed using relatively undisturbed thin-wall Shelby tube samples of the loam. The lab tests are intended to characterize the shear strength and stress history of the loam. Shear strength testing included unconsolidated-undrained (UU) triaxial tests within the embankment fill and loam, as well as consolidated-undrained triaxial tests with pore pressure measurements (CU-bar) within the loam. Attempts were also made to characterize the residual strength of the loam with residual direct shear tests. In a residual direct shear test, the direct shear box is displaced back-and-forth to achieve increasingly greater displacement with each cycle in an attempt to characterize residual shear strength. Unfortunately, tests of remolded specimens from split spoon samples resulted in unrealistically low strengths (zero shear resistance, even negative resistance in one case), and tests of relatively undisturbed specimens from Shelby tube samples resulted in unrealistically high strengths (strength that increased when the shear box direction was reversed).

6. Overview of Subsurface Conditions

As mentioned in the introduction, subsurface conditions at the site consist of approximately 50 ft of loam overlying approximately 20 ft of sand atop bedrock, which typically consists of a few feet of coal over shale. The loam is an alluvial deposit that varies in composition, but predominately consists of silt-sized particles. Tests from the 2024 borings indicate the percentage of silt particles ranges from 37 to 87, averaging 61. Clay-sized particles comprised an average of 22 percent of the samples, with sand-sized particles averaging 17 percent. These percentages are comparable with values from the 2010 SGR borings. Uncorrected Standard Penetration Test (SPT) N values in the loam from the 2024 borings range from 1 to 13 blows/ft (bpf), averaging 5 bpf. Of the 41 SPTs in loam, 27 resulted in N values from 3 to 5 bpf, with only three values less than 3 bpf. Within the sand, SPT values ranged from 10 to 36 bpf, averaging 24 bpf. These values are from the 2010 SGR borings; the 2024 investigation blind drilled (drilled without sampling) through most of the sand.

Borings indicate the embankments are comprised of lean clay fill. The 1954 plans for the original, EB embankment indicate embankment material came from a borrow pit near North St. in Murphysboro. The 1970s Soils Report for the WB embankment indicates embankment material came from “unrestricted” material, primarily loess, to be excavated in earthwork operations for the same roadway project, which extended from the project site east to Carbondale. The 1970s report specifically calls out the alluvial loam material as being “restricted” from use as embankment fill.

7. Characterization of the Loam

DBA used results of the laboratory testing presented in the GDR to characterize the loam and develop a shear strength model for use in slope stability analysis. The shear strengths were corroborated with back-calculation of slope stability analysis for the west bank of the EB structure. Moisture content and Atterberg limit results are presented in Figure 6. The index properties are relatively consistent with depth. The moisture content varies from 17 to 70 percent, averaging 30. Liquid limit varies from 25 to 49 percent, averaging 36, and the plasticity index varies from 9 to 33 percent and averages 17. The material classifies as a low plasticity silt (ML). Although the loam is low plasticity, its moisture content is generally near the liquid limit, with an average liquidity index of 0.67. A notable exception is from B-245 near Elevation 342, where the moisture content is 70 percent, compared to a liquid limit of 44 percent. A UU test from this sample resulted in undrained shear strength of 400 psf.

One-dimensional consolidation tests were performed on eight specimens, two from each of the borings except B-241. (B-241 was sampled using a piston sampler device intended for sandy materials, resulting in highly disturbed samples inappropriate for strength and stiffness testing.) DBA interpreted the test results to estimate the maximum past pressure (aka preconsolidation

pressure) from each test, with results plotted versus elevation in Figure 7. The figure includes lines for the estimated in-situ effective stress based on observed groundwater conditions. (The stress is greater for B-243 because of the embankment.) The results indicate the loam is lightly to moderately overconsolidated, with overconsolidation ratios (OCR) ranging from 1.7 to 4.6. Significant variation is observed among the maximum past pressure values, but with no apparent trend by location. Deeper samples produced greater maximum past pressure values in each boring.

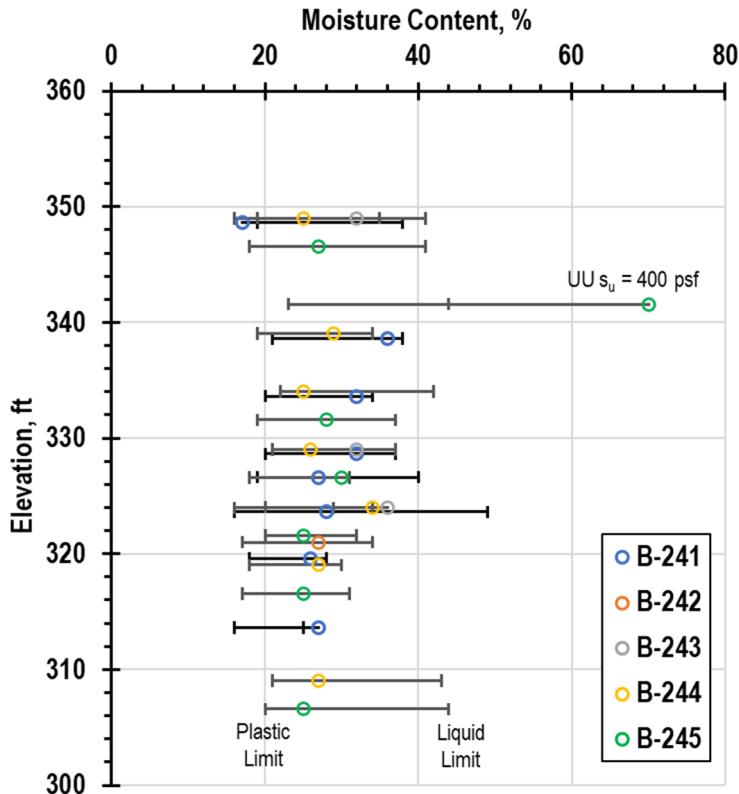

Figure 6: Moisture content and Atterberg limits versus elevation.

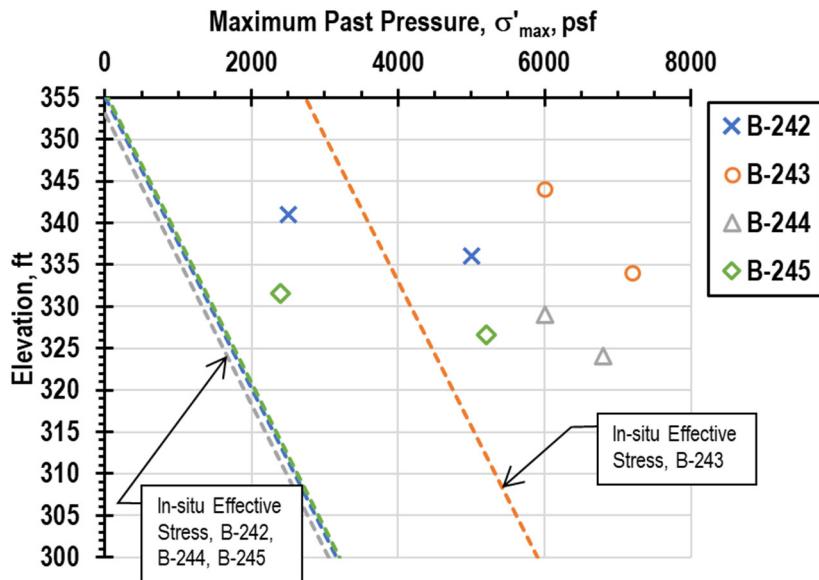

Figure 7: Maximum past pressure versus elevation.

Shear strength of the loam was primarily characterized using CU-bar test results following the Stress History And Normalized Soil Engineering Properties (SHANSEP) technique (Ladd and Footh, 1974). The SHANSEP technique was used to reduce the effects of sample disturbance by consolidating the specimens to stress levels several times greater than in-situ stresses (and greater than the maximum past pressure values from Figure 7) during the consolidation stage of the test. Prior to the shearing stage of the test, most of the specimens are unloaded to achieve known overconsolidation ratios ranging from 2 to 8, while one-third of the specimens were held at the maximum consolidation stress. Results of the shear test are used to determine the ratio of undrained shear strength (s_u) to effective stress (σ'_v) (i.e., the undrained strength ratio).

Results of SHANSEP testing are presented as the undrained strength ratio versus overconsolidation ratio in Figure 8. With the exception of one specimen from B-243 ST-16, the data exhibit relatively small scatter about the overall regression line of $\frac{s_u}{\sigma'_v} = 0.33 \cdot OCR^{0.84}$. The reduction in scatter compared to typical scatter observed in UU testing is a primary advantage of the SHANSEP technique. The specimen from B-243 ST-16 was excluded from the regression because its results were inconsistent with typical results for an overconsolidated specimen (e.g., no clear peak in shear stress was observed, and positive excess pore pressures were generated during shearing). The unusual results are most likely a result of the slickensides observed in the specimen, with the specimen potentially taken from a zone of sliding.

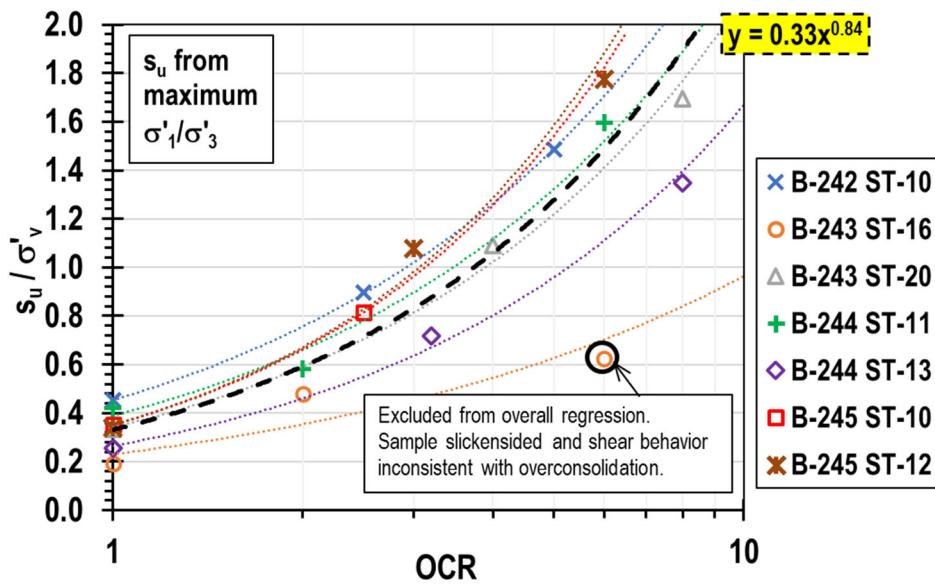

Figure 8: Undrained strength ratio versus overconsolidation ratio from CU-bar tests.

The undrained shear strength associated with the SHANSEP results is plotted versus elevation in Figure 9 for the west side of the river and in Figure 10 for the east side of the river. The undrained strength is calculated from $\frac{s_u}{\sigma'_v} = 0.33 \cdot OCR^{0.84}$, with OCR calculated assuming a maximum past pressure of 3,000 psf based on Figure 7. Also included in each figure are undrained shear results from UU tests and undrained shear strengths estimated from CPT results.

The SHANSEP strength profile was used in the slope stability analysis and in estimation of p-y parameters for laterally loaded pile analysis. The SHANSEP strength profile is more reliable than UU tests because the effects of sample disturbance are reduced, and more reliable than estimates based on CPT, which are subject to considerable uncertainty in the N_{kt} parameter.

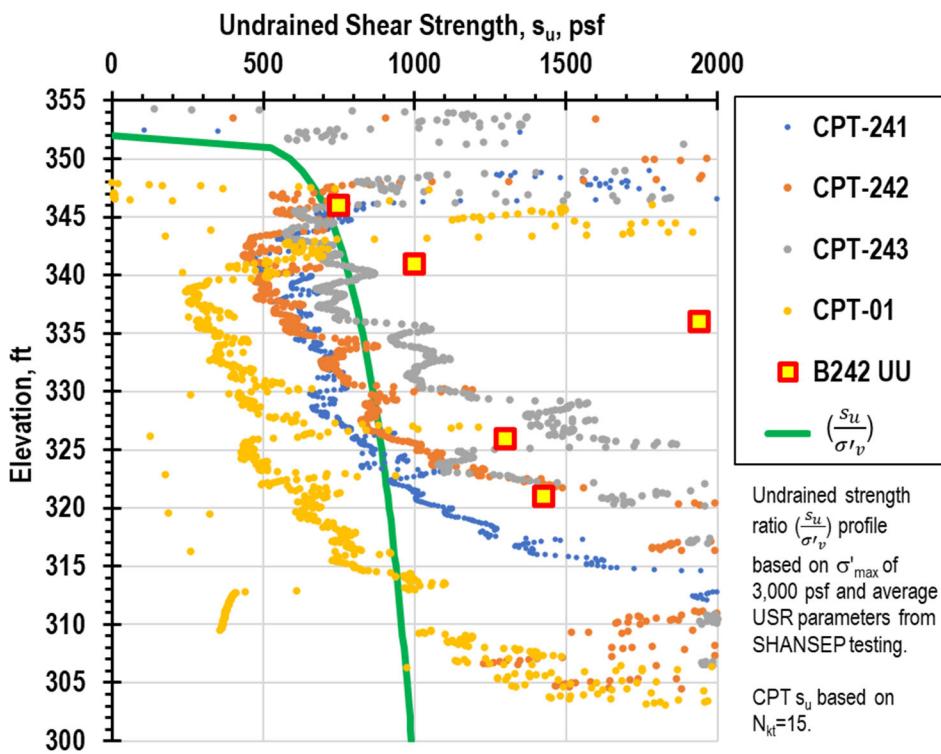

Figure 9: Undrained strength versus elevation for west side of river.

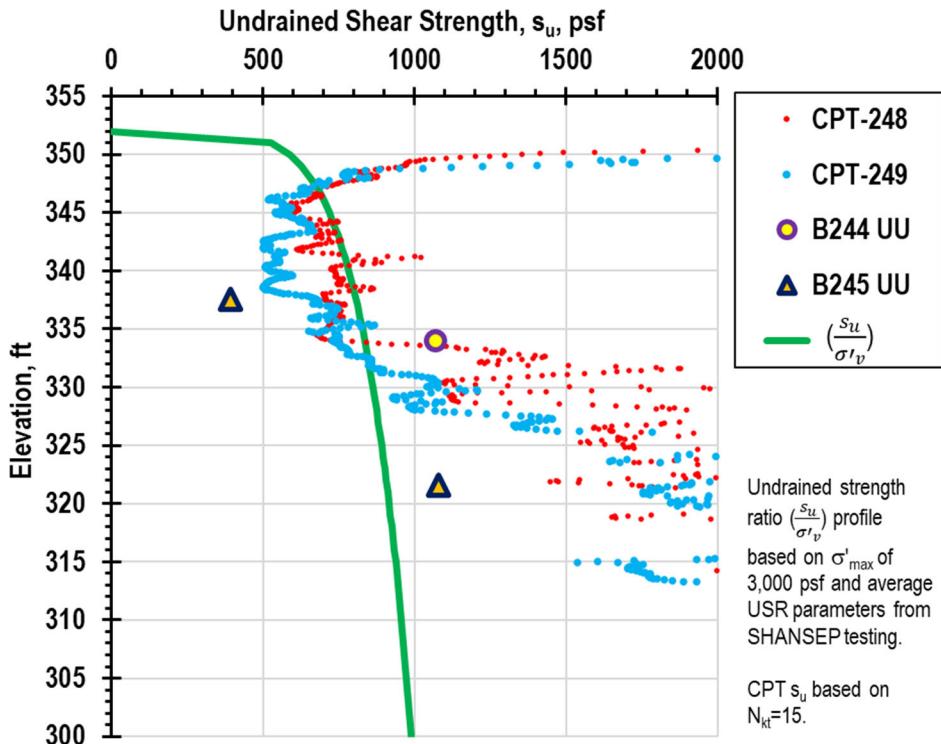

Figure 10: Undrained strength versus elevation for east side of river.

8. Observed Groundwater Conditions

As explained above, the piezometer installed in 2022 (H-2) indicated groundwater pressure within the sand layer that was elevated significantly above the river level. This observation of artesian groundwater conditions motivated installation of 15 additional piezometers, with sensors grouted in place at 3 depths for each of five locations. In addition, CPT dissipation tests were performed at 10 locations, each including tests at no fewer than three depths. Results from the piezometers and dissipation tests are presented in this section.

Piezometer data are presented in Figure 11 for location B-241 and in Figure 12 for location B-243. As shown in Figure 4, B-241 is on the access road beneath the bridge, near the toe of the WB embankment, and B-243 is atop the WB embankment, just behind the abutment. Results for other piezometers are presented in Appendix A. In each plot, piezometer results are presented as piezometric elevation versus time. Piezometric elevation is the elevation to which water would rise if a standpipe piezometer were screened at the location of the vibrating wire sensor. It is calculated by adding the measured pore water pressure in equivalent feet of water (1 ft of water equals 62.4 psf) to the sensor elevation. Three piezometric elevation lines are shown on each plot, one for each sensor. Sensor elevations are indicated in the plot legend. Piezometric elevation from the CPT dissipation tests nearest the piezometer are also shown on the plot. The dissipation test results are indicated with "X" points at the date and time of the test. Finally, each plot also includes lines for the ground surface elevation and the river elevation versus time as well as daily precipitation totals (as vertical bars referring to the right vertical axis).

Results from B-241 indicate piezometric elevations in the upper loam (El. 335), lower loam (El. 320), and sand (El. 304) are all within a couple of feet of El. 355 during times when the river is flowing at El. 340, the "normal" river elevation. Two dissipation tests from CPT-241, both near the top of sand, corroborate the piezometer results from March. Together, the results from B-241 and CPT-241 suggest that for relatively static conditions, groundwater throughout the profile is consistently 15 ft above the river level. There is no clear indication of vertical flow within the profile, with all three sensors recording relatively similar piezometric elevations (and with the greatest value from the middle sensor). As the river rose nearly 20 ft from April through June, piezometric elevations increased but significantly less than the river, with the lower and middle sensors increasing approximately 5 ft and the upper sensor increasing 8 ft to match the river level. The results suggest the artesian effects diminish during times of flooding, which is logical.

As shown in Appendix A, conditions similar to those at B-241 were encountered at B-242 (also from the access road, but north of the WB embankment) and at B-244 and B-245 (both from the east side of the river) during March. For all three piezometer locations, piezometric elevations for all three sensors were at approximately El. 355 throughout March. For all three locations, nearby CPT dissipation tests corroborate the piezometer results, although the dissipation tests from CPT-249 are curiously all 5 ft below the piezometric elevations from B-245, which are consistent at El. 355. Results for B-244 in April through June show similar trends as observed for B-241, with piezometer sensors rising significantly less than the river. Unfortunately, B-242 and B-245 have not collected data since March 2024. Millennia coordinated with Geokon and attributed the problem to issues with the cable trenched through the fill. IDOT should consider replacing the cables to restore operation of the piezometers.

Results from piezometer B-243, which was drilled through the EB embankment just west of the bridge abutment, are notably different from the other piezometers. The sensor within the sand and CPT-245 dissipation tests from four elevations within the loam all indicate piezometric elevation near El. 355 during March, consistent with results from the other piezometers. However, results from the piezometer sensor at El. 339 (in the loam, 15 ft below the ground surface, and just 1 ft above a nearby dissipation test) indicate a piezometric elevation of El. 364, and the

piezometer sensor within the embankment fill (at El. 361) shows a piezometric elevation of El. 378. El. 378 is 25 ft above the natural ground surface (beneath the embankment), and nearly 40 ft above the Big Muddy level during March. Results from B-243 are also unique in that they show little to no response to rising river levels.

Results from the middle and upper B-243 sensors are perplexing. In part, this is because the results are starkly different from the other piezometer results. In addition, it is difficult to explain how such great pressures could be observed within an embankment when pressures within the underlying strata are significantly and consistently lower. However, it would likely be unwise to ignore the B-243 results as an inconsequential outlier or measurement error. Although the dissipation test curve is somewhat unusual (with an abrupt termination of dissipation), the dissipation test from El. 340 in CPT-246 (just north of the WB embankment) also indicates a piezometric elevation above El. 370. In addition, there is an existing PVC pipe that discharges at the north face of the WB embankment near approximately El. 375 and is consistently flowing, even during extended periods with no rainfall.

The observations described in the preceding paragraph motivated the recommendation for the project team to investigate potential sources of groundwater within the embankment or upper portion of the underlying foundation (e.g., a leaking or broken pipe). Unfortunately, research by IDOT in coordination with the City of Murphysboro did not reveal any explanation for the observed groundwater pressures and the source of the artesian pressures remains unknown.

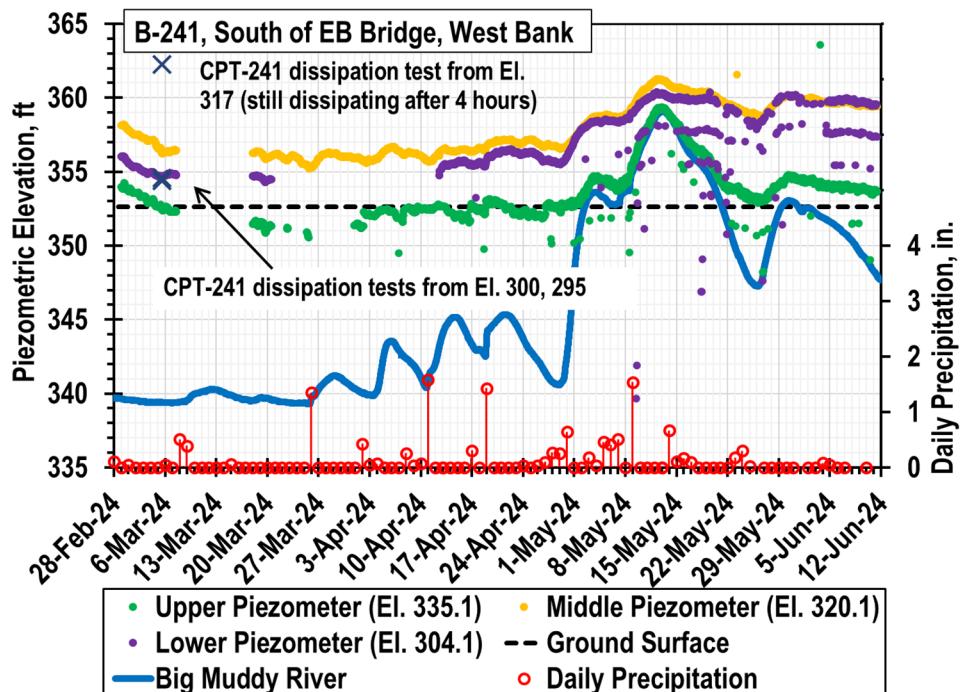

Figure 11: Results from Piezometer B-241 and CPT-241 dissipation tests.

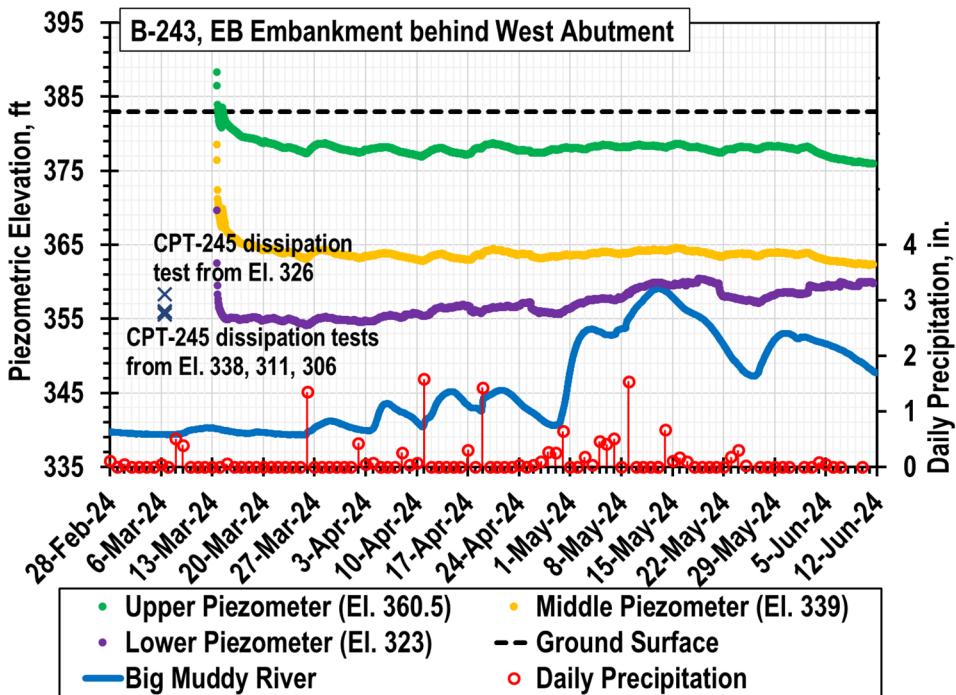

Figure 12: Results from Piezometer B-243 and CPT-245 dissipation tests.

A summary of all groundwater information from March 2024 is presented in Figure 13. The figure is a cross-section of the subsurface looking upstream, with the west embankment on the left side of the plot and the east embankment on the right. The solid black line shows the ground surface, and the river is shown with the horizontal blue line at El. 340. The elevation of the top of sand is shown with gold points near the bottom of the plot, with a different symbol for each subsurface exploration, as indicated in the legend. Vertical lines are used to represent locations with piezometric information, with solid lines for vibrating wire piezometers and dashed lines for CPT dissipation tests. Importantly, the vertical lines are not placed at precise locations on the cross-section; for clarity of presentation, most of the lines are shifted from their actual location so that all results can be included on the plot. On each vertical line, horizontal ticks are used to represent elevations where piezometric information is measured, with green for the bottom sensor or dissipation test, blue for middle, and purple for top. The open symbols near the top of the vertical lines are the observed piezometric elevations, with colors corresponding to the sensor colors. Boring or CPT designations are shown with labels near each point.

The piezometric elevations indicated with the open symbols are consistent with the discussion of results from B-241 and B-243 above. A significant majority of the information – results from more than 40 dissipation tests or piezometer sensors – indicate piezometric elevation between El. 352 and 358. However, several important outliers standout. As discussed above, the middle and top sensors from B-243 indicate piezometric elevations of El. 364 and 378, respectively, and the dissipation test in the upper loam of CPT-246 also indicates a piezometric elevation above El. 370. The upper loam dissipation test from CPT-247 (the sounding furthest behind the west abutment) was terminated at 4 hours with the piezometric elevation at El. 376 and still decreasing. Fitting an exponential decay curve to the results from that test suggest it would have reached equilibrium near El. 361, which is perhaps a low estimate.

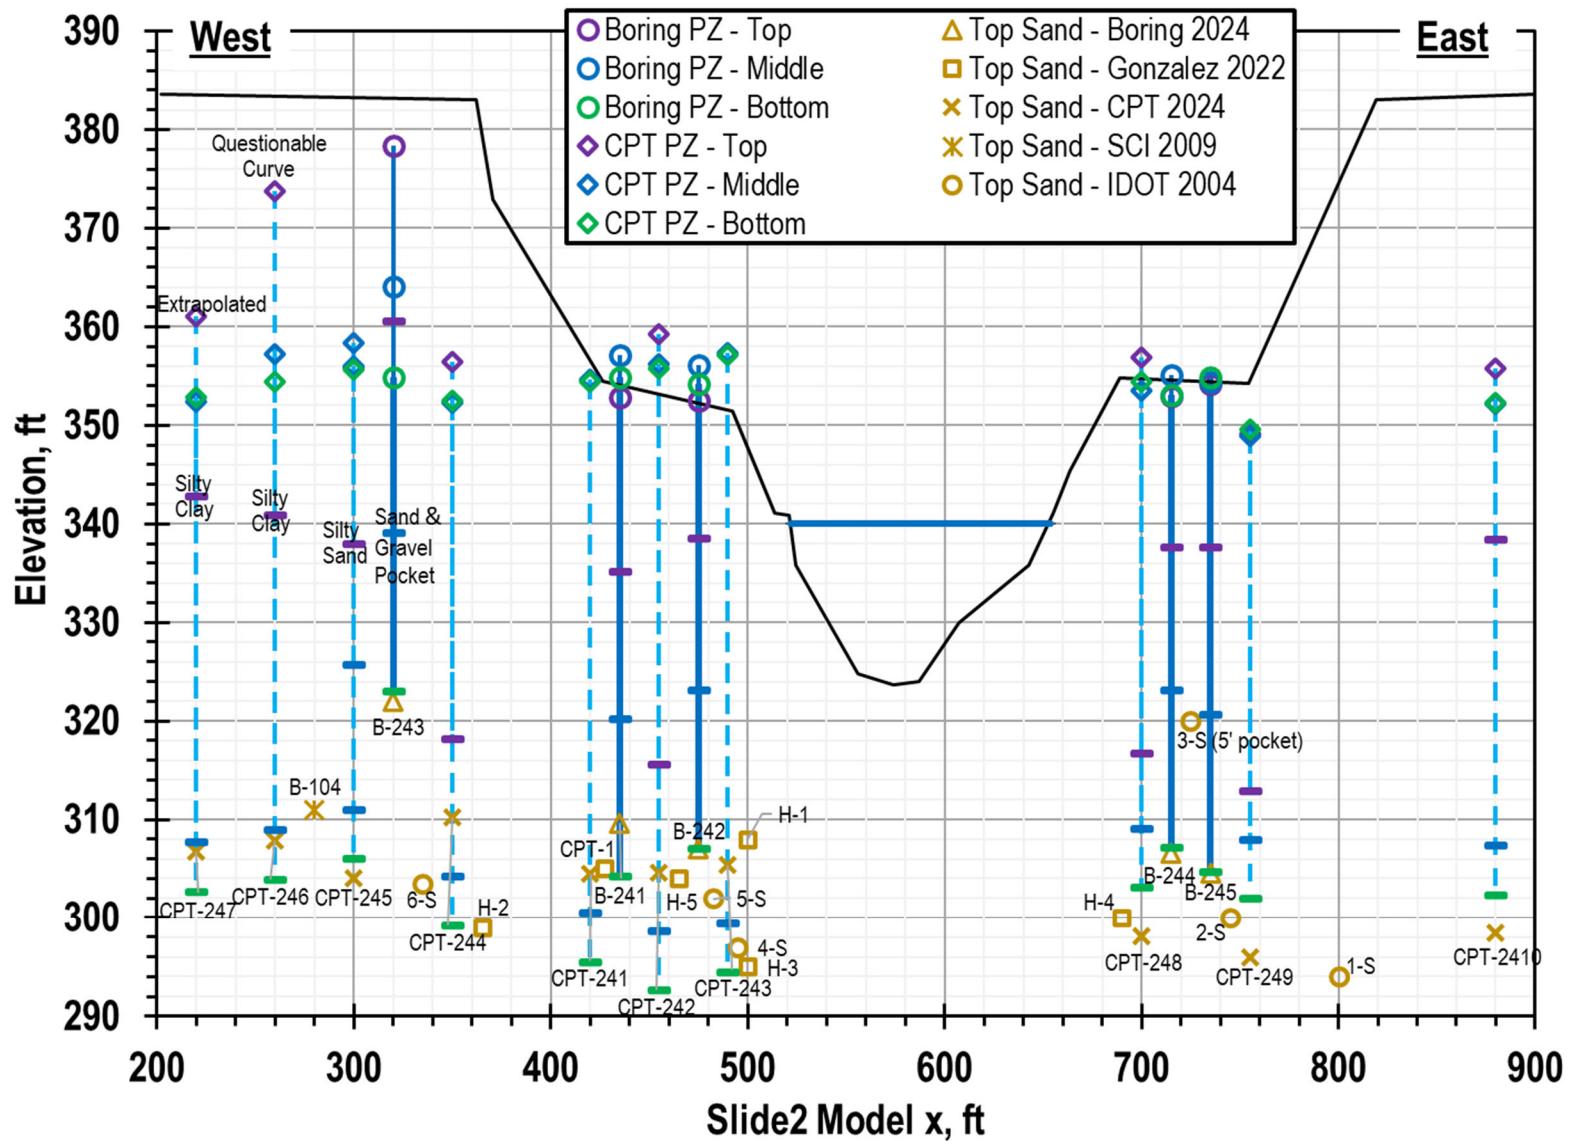

Figure 13: Summary of March 2024 piezometric data.

9. Calibration of Slope Stability Model for Existing Conditions

To evaluate the observed instability, a limit equilibrium slope stability model of the Big Muddy site was created with Rocscience Slide2 (Build 9.034). The goal of calibration is to produce a stability model that can be used to reliably analyze potential remediation concepts. Calibration takes advantage of a valuable piece of information available regarding the Big Muddy west embankment: its factor of safety for stability is near 1.0 based on observed instability.

Important input parameters for limit equilibrium slope stability models include geometry, material properties (strength and unit weight), and groundwater conditions (pore pressures). The geometry for the calibration model is based on the most recent survey data, which includes bathymetric survey information beneath the Big Muddy. Material properties for the calibration model are summarized in Table 1.

Table 1: Material properties for calibration model.

Material	Unit Weight	Strength
Embankment Fill	125 lb/ft ³	Fully softened per Stark and Hussain (2013)
Loam	120 lb/ft ³	SHANSEP model described in Section 7: $\frac{s_u}{\sigma'_v} = 0.33 \cdot OCR^{0.84}$ OCR from σ'_{max} of 3,000 psf
Sand	125 lb/ft ³	Friction angle of 36 deg. (cohesionless)

Several comments support the material property selection:

- Duncan and Wright (2014) note that calibrated strength parameters for failed clay embankment materials generally correspond to fully softened strength, an observation they attribute to wetting and drying cycles. Wetting and drying cycles have presumably occurred for the Big Muddy embankments. To estimate fully softened strength of the embankment material, correlations from Stark and Hussain (2013) were applied. The correlations predict fully softened and residual strength from index properties (liquid limit and clay fraction) based on a large database of ring shear tests. Values corresponding to the average minus one standard deviation were used to improve the calibration.
- The sand strength is modeled with a friction angle of 36 degrees. This is a relatively conservative estimate based on SPT N values in the sand, which averaged 24, but is sufficient to prevent critical sliding surfaces from passing through the sand.
- Unit weight values for the fill and loam are based on average values from Shelby tube specimens. A typical value is used for the sand; results of the stability model are insensitive to the sand unit weight.

To model groundwater conditions, the measured pore pressures are entered into the model as a grid as explained in the preliminary design report and shown in Figure 14. The blue triangles are shown at the piezometer sensor locations, and the values above the triangles are the piezometric elevation. The stability software interpolates between grid points to compute pore pressures along potential sliding surfaces. Results from CPT-246, B-243, and B-241 are used to develop the grid. These locations recorded the greatest piezometric elevations, and they fall along a plan view line that corresponds with observed movement directions. An additional column of points was added near the crest of the embankment using the same values as from B-243. The additional column was included to evaluate the possibility that elevated pore pressures similar to the B-243 measurements would be observed near the crest if measurements were available. Grid points are

also included near the river to represent the observed baseline piezometric elevation of El. 355 within sand across the site.

Results of the calibration model are presented Appendix B. The factor of safety for existing conditions is computed to be between 1.1 and 1.2 (specifically, but with more precision than is warranted for slope stability results, 1.18). As noted at the start of this section, a factor of safety near unity is consistent with the history of instability at the site. The calibration model is based on unbiased estimates of (1) shear strength in the loam from a comprehensive laboratory test program and (2) pore pressures from a robust groundwater monitoring system. That these estimates did not require modification to produce an outcome consistent with historical performance of the embankment is evidence of the reliability of the model and the value of the 2024 investigation program. It is also worth noting that the factor of safety for the baseline conditions is greater than would be experienced during periods when the river level falls but the piezometric elevations remain elevated. Such conditions have most likely occurred during the embankment's history, but have not occurred during the monitoring period of this report.

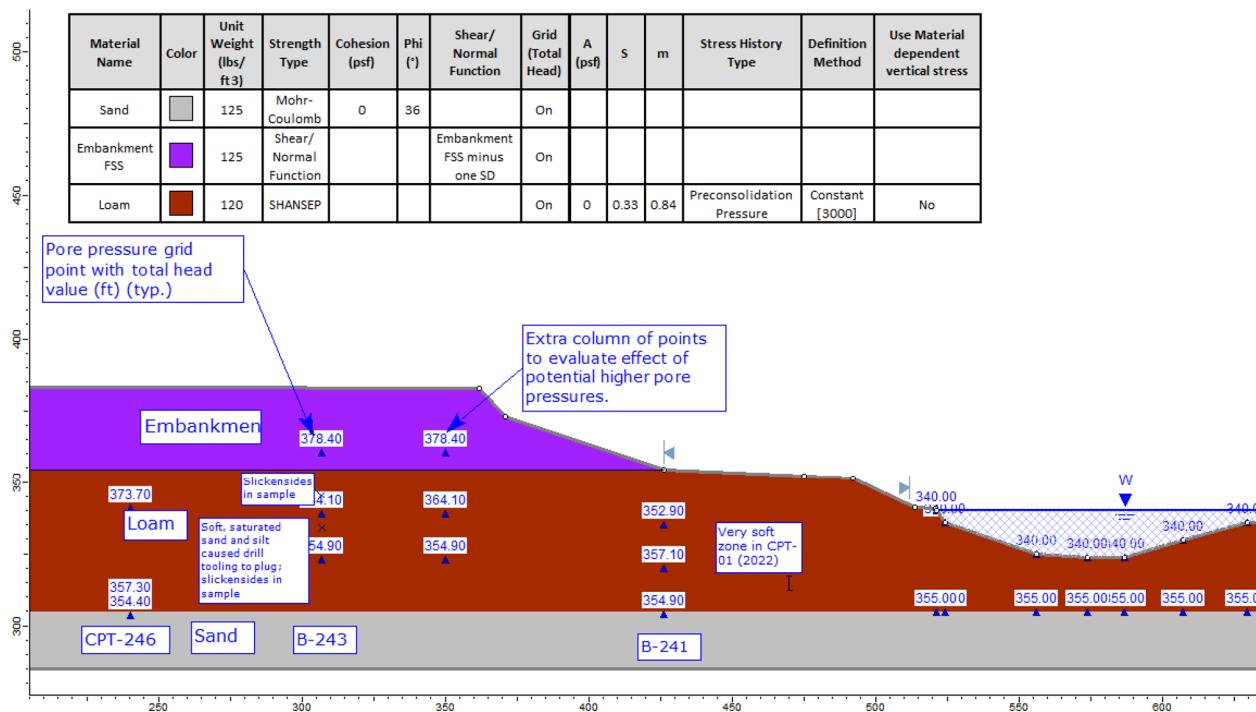

Figure 14: Slope stability model, with pore pressure grid values shown as total piezometric head at sensor locations.

10. Recommended Mitigation Concept

The recommended mitigation technique for Big Muddy is installation of large diameter open-ended driven pipe piles. Like other reinforcement techniques, pipe piles provide reliable, maintenance-free stabilization. Unlike other reinforcement techniques, which are installed by drilling, pipe piles avoid risks associated with elevated groundwater conditions during construction. In addition, pipe piles can be installed more quickly than other types of reinforcement.

Several alternative remediation concepts are feasible to address the observed instability at the Big Muddy site. The methods and their limitations are presented in Table 2. The first alternative listed in the table, drainage features, was recommended in the preliminary design report by DBA

(April 17, 2021). While drainage features are a proven and generally cost-effective mitigation technique that would directly address the primary cause of instability at Big Muddy (elevated groundwater conditions), they have several drawbacks at Big Muddy. Most importantly, they would likely be insufficient to independently increase the factor of safety to 1.5, requiring additional measures. In addition, the drains require periodic maintenance that would be unfamiliar to any DOT and involve uncertain life-cycle costs. Uncertainties due to environmental regulations associated with discharge into the river are also a concern.

Table 2: Remediation alternatives.

Alternative	Description	Limitations
Drainage Features	Install a series of relief wells through river banks and horizontal drains in embankments to reduce pore pressures driving instability.	<ul style="list-style-type: none"> • Cannot achieve factor of safety of 1.5 without additional mitigation techniques. • Maintenance required to ensure operability of drainage system over time. • Environmental constraints may limit ability to discharge drainage water into river. • Uncertainty in cost, maintenance frequency, and ability to satisfy environmental constraints.
Drilled Shafts	Install drilled shafts to resist the force of the sliding mass.	<ul style="list-style-type: none"> • Maintaining a stable excavation in the loam and sand will be challenging. • Likely not be possible to install shafts beneath the bridge without temporarily removing girders. • Likely requires permanent steel casing of the same general size as the driven pipe pile solution.
Micropiles	Similar concept to drilled shafts, but with micropiles through a common capping beam, perhaps with ground anchors.	<ul style="list-style-type: none"> • Maintaining a stable drill hole and grouting would be challenging given groundwater conditions.
Ground Improvement	Use deep soil mixing, jet grouting, timber piles, pipe piles, or other methods to improve the ground resistance.	<ul style="list-style-type: none"> • May be difficult to achieve desired level of stabilization. • Potential overhead access issues for installation. • Influence of artesian pressure potentially affecting the quality of fluid grout.
Replace Affected Substructures	Replace Pier 4 and perhaps the west abutment to accommodate future movement of the slope.	<ul style="list-style-type: none"> • Requires re-design of the structure, or at least parts of it. • Requires another shutdown of the structure. • Movement of the slope would most likely continue.
Geometry Changes	Reduce the height of the slope or flatten the slope.	<ul style="list-style-type: none"> • The overall height cannot be changed. • Flattening the slope is likely not cost effective considering the ground conditions. • Flattening of slope may exacerbate the heave issue.

11. Analysis of Slope Stability with Driven Pile Stabilization

The calibrated stability model was used to analyze potential driven pile remediation schemes. The analyses were performed using LPILE (Version 2022.12.11) to predict pile reinforcement forces and Rocscience Slide2 to analyze slope stability, consistent with the procedures recommended in published reports from the Deep Foundations Institute and the Association of Drilled Shaft Contractors (Turner, et al., 2023; Loehr and Brown, 2008). The procedure uses the p-y method to predict the available shear resistance that can be mobilized in the pile for various potential sliding depths and for different magnitudes of slope displacement. The mobilized shear resistance is then defined as a function of sliding depth, with the resulting function used as an input in the Slide2 stability model. The procedure appropriately accounts for the soil-structure interaction inherent to passive remediation schemes, i.e., for the fact that the available reinforcement force depends on the magnitude of slope movement.

Mobilized shear force functions for various 60-inch diameter open-ended pipe piles are presented in Figure 15. Four functions are shown, each corresponding to a different magnitude of slope movement. The piles are driven through the loam and sand layers to bedrock, which is estimated at a depth of 68 ft beneath existing grade at the banks. Only 60-inch piles are considered because this is the minimum size to achieve the required factor of safety. For each of the functions, the mobilized shear force increases with the potential sliding depth. The greatest forces would be mobilized in the sand layer, but the forces within the sand are of little practical interest because sliding surfaces extending into the sand are unrealistic. The mobilized shear forces also increase significantly with slope movement. At 48 ft, which is near the depth of observed sliding from the inclinometer, the predicted mobilized shear force for 12 inches of slope movement is 500 kips, compared to 200 kips for 2 inches of slope movement. Because of the greater forces, greater wall thickness is required for greater slope movement.

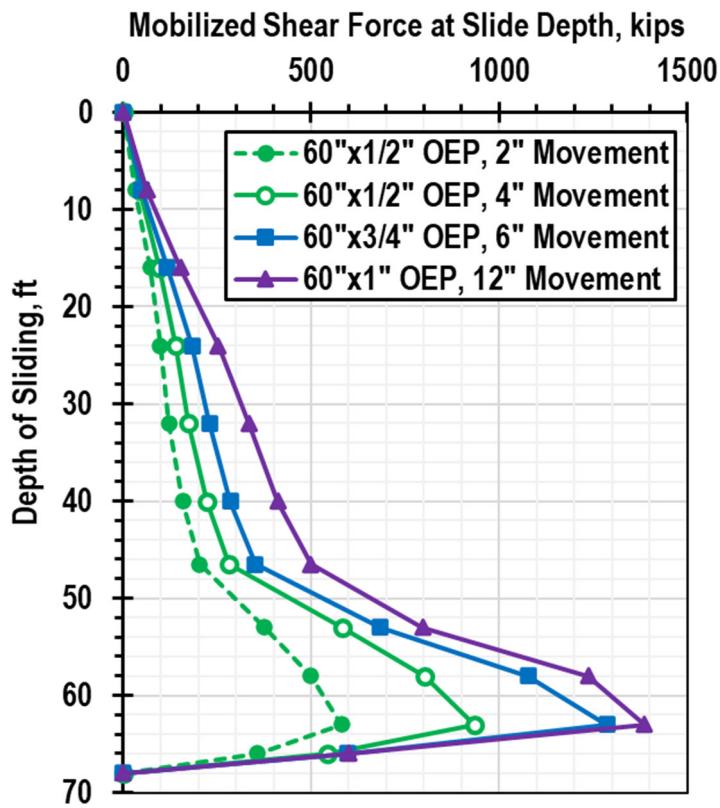

Figure 15: Mobilized shear force as a function of sliding depth.

The mobilized shear force functions from Figure 15 were used in the calibrated slope stability model presented in Section 9 to evaluate various remediation schemes. The forces from Figure 15 were divided by different pile spacing values (center-to-center) for entry in the two-dimensional model. Results from the model are shown in Figure 16, a plot of factor of safety versus pile spacing for two different levels of slope movement, 4 and 12 inches. Because greater movement mobilizes greater shear resistance, designing for 12 inches of movement is associated with greater factors of safety. Slope movement of 4 inches is a more practical design level, with reduced serviceability concerns as well as lower costs per pile because of reduced wall thickness.

Cost estimates in the figure are based on material costs of \$0.70 per pound, installation costs of \$200 per foot of pile, and an assumed length of improvement of 500 ft (250 ft on each side of the river). Other costs are not included.

As indicated in the figure, the recommended design scheme is 60-inch diameter by 0.5-inch thick open-ended pipe piles on 10 ft center-to-center spacing. The steel should be Grade 50 or better. This achieves a factor of safety greater than 1.5 for a design slope movement of 4 inches. It is important to recognize that the design level of slope movement is unlikely to be realized after installation. The slope will only move as far as necessary to mobilize a resisting force that halts movement. Because the stabilization is designed for a factor of safety of 1.5, the observed displacement is anticipated to be notably less than the design value. In other words, the factor of safety of 1.5 is “baked in” to potential movement of the pile beyond the level necessary to maintain stability.

Two rows of piles are required for the west bank, with the piles staggered between the two rows. As presented in the next section, one row of piles is required for the east bank. The piles should

be driven to bedrock from the bank in front of the abutments, with the lines of piles extending approximately 75 ft beyond the edges of the structures.

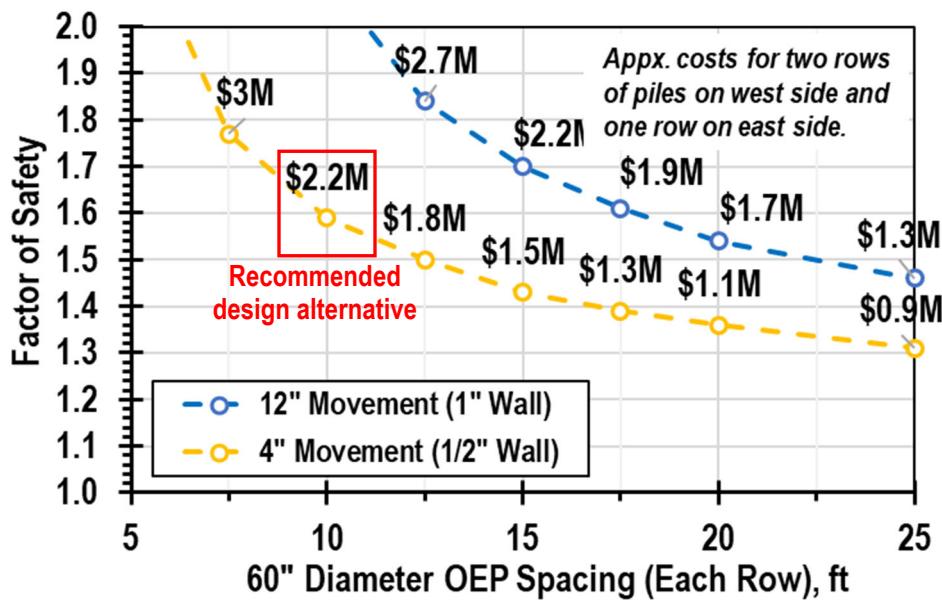

Figure 16: Factor of safety versus pile spacing for two different slope movement values.

Detailed results of the analysis for the recommended design scheme are presented in Appendices C, D, and E. Appendix C presents the LPILE output for 60-inch diameter by 0.5-inch thick pipe piles at 4 inches of slope movement. The LPILE models include a p-multiplier of 0.8 to account for pile spacing. The p-y parameters used for the soil layers are consistent with the parameters used in the calibration model (Section 9). In addition, the stiffness of the p-y model for the loam (specifically, the ϵ_{50} parameter) is based on UU test results. Soil movement is modeled as a constant value above the depth of sliding, with a 3-ft thick transition zone (from the assumed soil movement value to zero) centered at the depth of sliding. Appendix D is calculations demonstrating the pile structural resistance is adequate for bending moment and shear. Appendix E is output from Slide2 with the pile reinforcement.

12. Stability of East Embankment

Stability of the east embankment was evaluated using the strength parameters from calibration of the west embankment (Section 9) and groundwater conditions from the piezometer of B-244 and dissipation tests from CPT-248 and CPT-2410. Results are shown in Appendix E. For these baseline conditions, the model indicates a factor of safety of 1.3. This is consistent with a lack of observed performance issues on the east side of the river. Both sides of the river have similar materials and geometry; the difference in stability primarily results from differences in piezometric conditions. While baseline piezometric elevations of 355 ft are observed in the sand and loam on both sides of the river, piezometric elevations of 375 ft were only observed within the west embankment. To improve the factor of safety for the east embankment to 1.5, a single row of piles is required. Other than being installed in a single row, the piles should equivalent to those for the west embankment: 60-inch diameter by 0.5-inch thick, driven to rock, spaced at 10 ft center-to-center, and with the line extending approximately 75 ft beyond either side of the structures.

13. Stability of Riverbanks

The proposed pipe pile remediation plan improves the factor of safety for critical surfaces involving the bridge embankment to 1.5. The remediation does not improve stability for potential slip surfaces in front (i.e., riverward) of the proposed piles. The calibrated stability model does not indicate factors of safety less than 1.5 for such surfaces. However, there is no subsurface information available between the riverbanks, so evaluating stability of potential slip surfaces at the riverbanks using the calibrated model is associated with significantly more uncertainty than evaluating surfaces involving the bridge embankments. For perspective, the model from the preliminary design report (April 17, 2024) indicated factors of safety less than unity for riverbank surfaces. (The old model was based on correlations only, not laboratory tests of shear strength.)

The groundwater conditions indicate stability between the banks could be problematic, with potential seepage instability leading to slope instability. Consider potential heave of the loam between the deepest point in the channel and the top of sand. Groundwater at the top of sand is presumably near El. 355 based on measurements on both sides of the river. At the base of the channel, the water pressure is from the weight of water within the channel. The factor of safety against heave, FS_{heave} , is defined as the ratio of the total stress from soil (σ_{soil}) and water (σ_{water}) to the pore pressure at the base of the loam (u_{base}):

$$FS_{heave} = \frac{\sigma_{soil} + \sigma_{water}}{u_{base}}$$

The factor of safety is unity when the pressure at the base of the loam is equal to the pressure from the weight of overlying soil and water, indicating heave instability is imminent. The factor of safety is plotted versus the loam thickness in Figure 17. For the estimated top of sand elevation of 305, the heave factor of safety is just greater than 1, indicating marginal stability. Seepage instability can progress to slope instability when loss of material due to heave reduces passive resistance and leads to loss of slope stability.

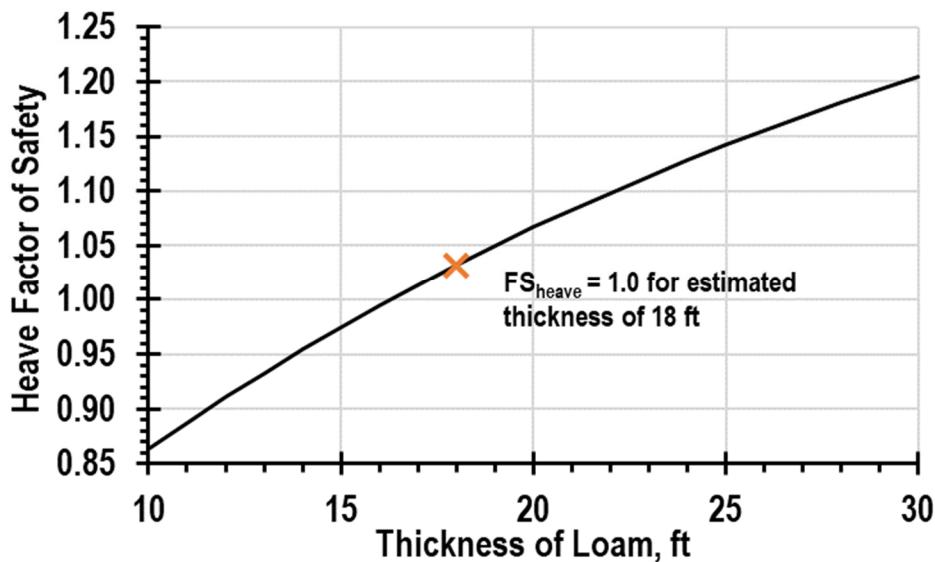

Figure 17: Heave factor of safety versus thickness of loam beneath lowest point in river.

In summary, stability of the riverbanks is uncertain, but likely associated with factors of safety less than 1.5 due to observed groundwater conditions, and because most riverbanks have a factor of safety closer to 1.0. The most effective means for addressing potential seepage instability is

ballast material, preferably rip-rap of size sufficient to reliably resist scour, at the base of the channel, but this is likely impractical due to environmental and navigation constraints. An alternative would be to perform visual inspections of the riverbank slopes, regrading as necessary to maintain the bank alignment.

14. Pile Driveability and Installation Recommendations

There is no requirement to demonstrate axial resistance during driving. Rather, the piles need only be advanced to the top of bedrock in order to provide the required lateral resistance. Pile driveability was evaluated using GRLWEAP 2010. Results are presented in the calculation package of Appendix F. The model was developed using soil input parameters consistent with the slope stability and lateral pile analyses. A pile driving hammer with rated energy of 107 kip-ft (Delmag D-46) was used as a preliminary evaluation of driveability. The Delmag D-46 and similar hammers are commonly available. The model output indicates the piles can be driven to bedrock before meeting practical refusal and without overstressing, with maximum predicted blow counts of 7 blows per inch and compressive stress of 21 kips/in². These results indicate the piles can be driven with commonly available pile driving hammers and without overstressing. The pile driving contractor should perform an independent analysis of pile driveability using details for the intended pile driving system.

It may be advantageous to advance the piles at least partially using a vibratory hammer. Use of vibratory methods can result in ground loss if the pile is vibrated beyond refusal (i.e., after the point at which it stops advancing). Plan notes and specifications should be developed to mitigate the risk of ground loss and effects on the existing bridge associated with vibratory methods.

15. Stability During Construction

Observed instability at the project site indicates the existing slopes are marginally stable under baseline conditions. As discussed in Section 9, the baseline stability model has a factor of safety between 1.1 and 1.2 for observed groundwater conditions and strength based on the SHANSEP model. Because the slope is marginally stable under baseline conditions, there is a risk that loading the slope with heavy construction equipment could produce instability.

For Big Muddy, it is not feasible to precisely analyze slope stability under construction loading for several reasons:

- The baseline factor of safety is between 1.1 and 1.2, which is an unacceptable condition.
- Construction loading will likely have the effect of temporarily decreasing the factor of safety. Even with a model built with high-quality information like the calibration model for Big Muddy, it would be an overreliance of the model to state that loading conditions producing a factor of safety of 1.0 are the precise conditions associated with instability, particularly when starting from a condition of the factor of safety between 1.1 and 1.2.
- Much of the pile installation is anticipated to occur along the banks of the river. As discussed in Section 13, this is the least precise area of the model.
- Two-dimensional slope stability models (like the model for Big Muddy) are inherently imprecise for evaluation of stability with construction loading, which is strongly influenced by three-dimensional effects.

Although quantitative analysis of stability during construction is not useful, several practical recommendations informed by slope stability considerations are important:

1. Heavy construction equipment should be tracked on thick, high-quality crane mats to distribute the loading over a wider area.
2. Construction staging should be carefully considered to improve stability. More stable staging would locate the crane in more stable areas of the slope. For example, pile installation could start with the crane located furthest from the river, with the crane following behind the pile installation. If possible, it may be beneficial to install some piles adjacent to the bridge with the crane parked on the bridge deck (after closing the bridge but before removing the deck).
3. Monitoring during construction could provide valuable information. Monitoring could include daily readings of inclinometers nearest areas of active construction as well as installation of survey monuments.

16. Instrumentation and Monitoring

Existing piezometers and inclinometers should continue to be monitored at least monthly until at least one year after installation of the piles. The monitoring program should also include regular surveys of control points established on the existing structure.

In addition, four of the pipe piles should be instrumented to measure deflected shape and associated loads imposed by the slope after installation. Instrumentation should consist of shape arrays installed within 1-inch, Sch. 40 steel pipes welded to the inside of the pipe pile. The welds should be sufficient for the Sch. 40 pipe to survive driving. The instrumentation will provide important data regarding performance of the piles in response to slope movement. The data will help evaluate stability in the unlikely event significant movement is observed. For the anticipated small levels of slope movement, the data will provide valuable and rare information regarding performance of piles for slope stabilization.

17. Path Forward

The following tasks are recommended to implement the remediation concept:

1. Develop plans and specifications for the pipe pile stabilization scheme. The plan notes and specifications should address the installation recommendations and constructability considerations presented in Sections 14 and 15.
2. Develop an instrumentation and monitoring plan with action levels.
3. Continue monitoring existing instrumentation during the design and construction phase (before transitioning to the instrumentation and monitoring plan of Item 2).
4. Implement the instrumentation and monitoring plan from Item 2.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	6.50000	4.00000
3	9.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1 No	1 Yes	V = 0.0000 lbs M = 0.0000 in-lbs		0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Deflect. Soil Spr. X Es*H lb/inch	Bending Moment Lat. Load in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	0.48748969 inches
Computed slope at pile head	=	-0.0017301 radians
Maximum bending moment	=	6793263. inch-lbs
Maximum shear force	=	48739. lbs
Depth of maximum bending moment	=	23.12000000 feet below pile head
Depth of maximum shear force	=	9.24800000 feet below pile head
Number of iterations	=	24
Number of zero deflection points	=	2

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Pile-head Type 1 Load 1 in-lbs	Load Pile-head Type 2 Load 2 in-lbs	Axial Loading Load 2 in-lbs	Pile-head Deflection y inches	Pile-head Rotation S radians	Max
1	V, lb 48739.	0.00	M, in-lb 6793263.	0.00	0.00	0.4875	-0.00173

Maximum pile-head deflection = 0.4874896916 inches
Maximum pile-head rotation = -0.0017301000 radians = -0.099127 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	14.50000	4.00000
3	17.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Soil Spr. Es*H lb/inch	Deflect. y inches	Bending Moment in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	2.04539178 inches
Computed slope at pile head	=	-0.0054199 radians
Maximum bending moment	=	18034186. inch-lbs
Maximum shear force	=	101432. lbs
Depth of maximum bending moment	=	31.2800000 feet below pile head
Depth of maximum shear force	=	16.72800000 feet below pile head
Number of iterations	=	27
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Type Pile-head in Pile Load 1 in-lbs	Load Type Pile-head Load 2 M, in-lb 101432. 1.80E+07	Axial Pile-head Loading Load 2 lbs	Deflection Pile-head Rotation inches radians	Max
1	V, lb 0.00	M, in-lb 0.00	0.00	0.00	2.0454	-0.00542

Maximum pile-head deflection = 2.0453917836 inches
Maximum pile-head rotation = -0.0054198666 radians = -0.310535 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	22.50000	4.00000
3	25.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in ²	Depth to N Axis in	Max Total Stress ksi	Run Msg

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	4.03032440 inches
Computed slope at pile head	=	-0.0087586 radians
Maximum bending moment	=	27628239. inch-lbs
Maximum shear force	=	142700. lbs
Depth of maximum bending moment	=	38.62400000 feet below pile head
Depth of maximum shear force	=	24.34400000 feet below pile head
Number of iterations	=	26
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Pile-head in Pile Load 1 in-lbs	Type Pile-head Type	Load Pile-head Load 2 in-lbs	Axial Loading Load 2 in-lbs	Pile-head Deflection y, inches	Pile-head Rotation S, radians	Max in inches
1	V, lb 142700.	0.00 2.76E+07	M, in-lb 2.76E+07	0.00 2.76E+07	0.00 2.76E+07	4.0303 -0.00876	-0.00876 -0.501828	-0.501828

Maximum pile-head deflection = 4.0303244021 inches
Maximum pile-head rotation = -0.0087585504 radians = -0.501828 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	30.50000	4.00000
3	33.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Deflect. Spr. X lb/inch	Bending Moment Es*H in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi**	Bending Stiffness 1b-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	4.81244453 inches
Computed slope at pile head	=	-0.0085409 radians
Maximum bending moment	=	31327051. inch-lbs
Maximum shear force	=	-208134. lbs
Depth of maximum bending moment	=	48.0080000 feet below pile head
Depth of maximum shear force	=	58.7520000 feet below pile head
Number of iterations	=	28
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Type Pile-head in Pile Load 1 in-lbs	Load Type Pile-head Load 2 M, in-lb -208134. 3.13E+07	Axial Pile-head Loading Load 2 lbs	Deflection Pile-head Rotation inches radians	Max
1	1	2	0.00	0.00	4.8124	-0.00854

Maximum pile-head deflection = 4.8124445255 inches
Maximum pile-head rotation = -0.0085408962 radians = -0.489357 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	38.50000	4.00000
3	41.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1 No	1 Yes	V = 0.0000 lbs	M = 0.0000 in-lbs	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Deflect. Soil Spr. X Es*H inches	Bending Distrib. Lat. Load in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	5.23326814 inches
Computed slope at pile head	=	-0.0075947 radians
Maximum bending moment	=	34783660. inch-lbs
Maximum shear force	=	-277069. lbs
Depth of maximum bending moment	=	51.13600000 feet below pile head
Depth of maximum shear force	=	60.52000000 feet below pile head
Number of iterations	=	27
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Type Pile-head in Pile Load 1 in-lbs	Load Type Pile-head Load 2 in-lbs	Axial Loading Load 2 in-lbs	Pile-head Deflection y, inches	Pile-head Rotation S, radians	Max
1	V, lb -277069.	0.00	M, in-lb 3.48E+07	0.00	0.00	5.2333	-0.00759

Maximum pile-head deflection = 5.2332681356 inches
Maximum pile-head rotation = -0.0075946697 radians = -0.435143 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	45.00000	4.00000
3	48.00000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Deflect. Es*H lb/inch	Bending Moment in-lbs lb/inch	Shear Force lbs	Slope radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	5.34765934 inches
Computed slope at pile head	=	-0.0067082 radians
Maximum bending moment	=	33630950. inch-lbs
Maximum shear force	=	-305870. lbs
Depth of maximum bending moment	=	53.17600000 feet below pile head
Depth of maximum shear force	=	61.33600000 feet below pile head
Number of iterations	=	27
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Type Pile-head in Pile Load 1 in-lbs	Load Type Pile-head Load 2 in-lbs	Axial Loading Load 2 in-lbs	Pile-head Deflection y, inches	Pile-head Rotation S, radians	Max
1	V, lb -305870.	0.00	M, in-lb 3.36E+07	0.00	0.00	5.3477	-0.00671

Maximum pile-head deflection = 5.3476593425 inches
Maximum pile-head rotation = -0.0067082325 radians = -0.384353 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	51.50000	4.00000
3	54.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1 No	1 Yes	V = 0.0000 lbs M = 0.0000 in-lbs		0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Deflect. Soil Spr. X Es*H lb/inch	Bending Moment Lat. Load in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	5.11433412 inches
Computed slope at pile head	=	-0.0028543 radians
Maximum bending moment	=	-33988851. inch-lbs
Maximum shear force	=	597679. lbs
Depth of maximum bending moment	=	42.70400000 feet below pile head
Depth of maximum shear force	=	53.31200000 feet below pile head
Number of iterations	=	26
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Pile in Pile No. 1 lbs	Load 2 Type in-lbs	Load Type	Axial Pile-head Loading	Max Shear Moment	Pile-head Deflection	Pile-head Rotation	Max in	
1	V, lb 597679.	0.00 -3.40E+07	2	M, in-lb 0.00	Load 1 2	Load 2 lbs	Deflection inches	Rotation radians	

Maximum pile-head deflection = 5.1143341197 inches
Maximum pile-head rotation = -0.0028543109 radians = -0.163540 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	56.50000	4.00000
3	59.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in ²	Depth to N Axis in	Max Total Stress ksi	Run Msg

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Deflect. Soil Spr. X Es*H inches	Bending Moment Lat. Load in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection	=	4.58299723 inches
Computed slope at pile head	=	0.00003295 radians
Maximum bending moment	=	-67817870. inch-lbs
Maximum shear force	=	812374. lbs
Depth of maximum bending moment	=	50.72800000 feet below pile head
Depth of maximum shear force	=	58.20800000 feet below pile head
Number of iterations	=	22
Number of zero deflection points	=	1

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Shear Max Pile in Pile No. 1 lbs	Load Pile-head in Pile Load 1 in-lbs	Type Pile-head Type	Load Pile-head Load 2 in-lbs	Axial Loading Load 2 in-lbs	Pile-head Deflection y, inches	Pile-head Rotation S, radians	Max in inches
1	V, lb 812374.	0.00 -6.78E+07	M, in-lb -67817870.	0.00 812374.	0.00 812374.	4.5830 4.5829972255	3.30E-05 0.001888	inches deg.

Maximum pile-head deflection = 4.5829972255 inches
Maximum pile-head rotation = 0.0000329505 radians = 0.001888 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	61.50000	4.00000
3	64.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in ²	Depth to N Axis in	Max Total Stress ksi	Run Msg

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Soil Spr. X Es*H lb/inch	Deflect. y Lat. Load inches lb/inch	Bending Moment in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection = 3.98855822 inches
Computed slope at pile head = 0.00145504 radians
Maximum bending moment = -71479902. inch-lbs
Maximum shear force = 934826. lbs
Depth of maximum bending moment = 55.08000000 feet below pile head
Depth of maximum shear force = 62.96800000 feet below pile head
Number of iterations = 25
Number of zero deflection points = 0

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Pile in Pile No. 1 lbs	Load 2 Type in-lbs	Load Pile-head Type	Axial Pile-head Loading	Deflection Rotation	Pile-head Max
1	V, lb 934826.	0.00 -7.15E+07	2	M, in-lb 0.00	0.00	3.9886 0.00146

Maximum pile-head deflection = 3.9885582171 inches
Maximum pile-head rotation = 0.0014550442 radians = 0.083368 deg.

The analysis ended normally.

Problem Title

Project Name: IL-13 over Big Muddy Stabilization

Job Number: 23-106

Client: Oates / IDOT

Engineer: Andy Boeckmann

Description: Predict loads in large pipe piles from soil movement

Program Options and Settings

Computational Options:

- Conventional Analysis

Engineering Units Used for Data Input and Computations:

- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- | | | |
|--|---|---------------|
| - Maximum number of iterations allowed | = | 500 |
| - Deflection tolerance for convergence | = | 1.0000E-05 in |
| - Maximum allowable deflection | = | 100.0000 in |
| - Number of pile increments | = | 500 |

Loading Type and Number of Cycles of Loading:

- Static loading specified
- Analysis uses p-y modification factors for p-y curves
- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Analysis includes loading by one lateral soil movement profile acting on pile
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:

- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined	=	1
Total length of pile	=	68.000 ft
Depth of ground surface below top of pile	=	0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	60.0000
2	68.000	60.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a steel pipe pile

Length of section	=	68.000000 ft
Pile diameter	=	60.000000 in

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is soft clay, p-y criteria by Matlock, 1970

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	48.000000 ft
Effective unit weight at top of layer	=	57.600000 pcf
Effective unit weight at bottom of layer	=	57.600000 pcf
Undrained cohesion at top of layer	=	600.000000 psf
Undrained cohesion at bottom of layer	=	975.000000 psf
Epsilon-50 at top of layer	=	0.015000
Epsilon-50 at bottom of layer	=	0.015000

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	48.000000 ft
Distance from top of pile to bottom of layer	=	68.000000 ft
Effective unit weight at top of layer	=	62.600000 pcf
Effective unit weight at bottom of layer	=	62.600000 pcf
Friction angle at top of layer	=	36.000000 deg.
Friction angle at bottom of layer	=	36.000000 deg.
Subgrade k at top of layer	=	60.000000 pci
Subgrade k at bottom of layer	=	60.000000 pci

(Depth of the lowest soil layer extends 0.000 ft below the pile tip)

Summary of Input Soil Properties

Layer E50	Soil Type	Layer	Effective	Cohesion	Angle of
Num. or krm	Name kpy (p-y Curve Type) pci	Depth ft	Unit Wt. pcf	psf	Friction deg.
-----	-----	-----	-----	-----	-----

1	Soft	0.00	57.6000	600.0000	--
0.01500	--				
	Clay	48.0000	57.6000	975.0000	--
0.01500	--				
2	Sand	48.0000	62.6000	--	36.0000
--	60.0000				
	(Reese, et al.)	68.0000	62.6000	--	36.0000
--	60.0000				

Modification Factors for p-y Curves

Distribution of p-y modifiers with depth defined using 2 points

Point No.	Depth X ft	p-mult	y-mult
1	0.000	0.8000	1.0000
2	68.000	0.8000	1.0000

Lateral Soil Movements Applied to All Load Cases

Profile of soil movement with depth defined using 4 points

Point No.	Depth X ft	Soil Movement in
1	0.00000	4.00000
2	64.50000	4.00000
3	67.50000	0.00000
4	68.00000	0.00000

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Compute No.	Load Top y Type vs. Pile Length	Condition Run Analysis 1	Condition 2	Axial Thrust Force, lbs
1	1	V = 0.0000 lbs No	M = 0.0000 in-lbs Yes	0.0000000

V = shear force applied normal to pile axis

M = bending moment applied to pile head

y = lateral deflection normal to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Values of top y vs. pile lengths can be computed only for load types with specified shear loading (Load Types 1, 2, and 3).

Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Steel Pipe Pile:

Length of Section	= 68.000000 ft
Outer Diameter of Pipe	= 60.000000 in
Pipe Wall Thickness	= 0.500000 in
Yield Stress of Pipe	= 50.000000 ksi
Elastic Modulus	= 29000. ksi
Cross-sectional Area	= 93.462381 sq. in.
Moment of Inertia	= 41363. in^4
Elastic Bending Stiffness	= 1.1995E+09 kip-in^2
Plastic Modulus, Z	= 1770.in^3

Plastic Moment Capacity = Fy Z = 88508.in-kip

Axial Structural Capacities:

Nom. Axial Structural Capacity = Fy As = 4673.119 kips
Nominal Axial Tensile Capacity = -4673.119 kips

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definition of Run Messages:

Y = part of pipe section has yielded.

Axial Thrust Force = 0.000 kips

Summary of Results for Nominal Moment Capacity for Section 1

Load No.	Axial Thrust kips	Nominal Moment Capacity in-kips
1	0.00000000	87924.

Note that the values in the above table are not factored by a strength reduction factor for LRFD.

The value of the strength reduction factor depends on the provisions of the LRFD code being followed.

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to the LRFD structural design standard being followed.

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	1342857.
2	48.0000	25.0439	No	No	1342857.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head	=	0.0 lbs
Applied moment at pile head	=	0.0 in-lbs
Axial thrust load on pile head	=	0.0 lbs

Res.	Depth feet	Soil Spr. Es*H lb/inch	Deflect. X inches	Bending Moment in-lbs lb/inch	Shear Force lbs	Slope S radians	Total Stress psi*lb-in^2	Bending	Soil p

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

Pile-head deflection = 3.95871904 inches
Computed slope at pile head = 0.00034515 radians
Maximum bending moment = -38100826. inch-lbs
Maximum shear force = 629159. lbs
Depth of maximum bending moment = 57.66400000 feet below pile head
Depth of maximum shear force = 65.14400000 feet below pile head
Number of iterations = 22
Number of zero deflection points = 0

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case Type	Load 1 Pile in Pile No. 1 lbs	Load 2 in-lbs	Load Type	Axial Pile-head Loading	Pile-head Deflection	Pile-head Rotation	Max in
Shear	Max	Moment	Pile-head	Pile-head	Deflection	Rotation	
1	Load 1	2	Type	Load 2	lbs	inches	radians
1	V, lb 629159.	0.00 -3.81E+07	M, in-lb	0.00	0.00	3.9587	3.45E-04

Maximum pile-head deflection = 3.9587190428 inches
Maximum pile-head rotation = 0.0003451549 radians = 0.019776 deg.

The analysis ended normally.

Loam	Dark Red	120	SHANSEP				On	0	0.33	0.84	Preconsolidation Pressure	Constant [3000]	No

APPENDIX G

Driveability Analysis Results

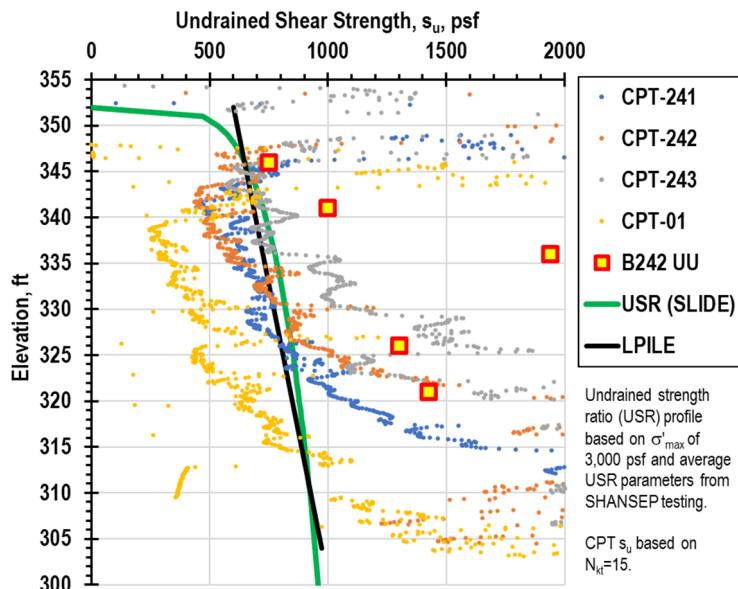

Pile Driveability

Overview

Evaluate driveability of 60-inch diameter by 0.5-inch wall thickness open-ended pipe piles at Big Muddy site to determine what size hammer can be used to drive piles without overstressing or meeting refusal. Use GRLWEAP 2010 to perform the analysis.

Inputs

Soil profile consists of silty loam over sand. Strength information for the silty loam is shown in the plot below. For the sand, SPT blow counts range from 10 to 36 blows/ft, averaging 24.

Use this information to evaluate static axial resistance per the inputs shown in the table below. The sand is conservatively assumed to be dense.

Soil Type	γ_t (pcf)	Cohesion	β	N_t	ϕ (°)	α	s_u (psf)	Set-Up Factor
Loam (Clayey Silt)	120	Y				0.8	800	2.5
Dense Sand	125	N	0.45	150	41			1.8

Corresponding unit side resistance is 0.6 ksf in the loam, and varies from 1.3 ksf at the top of sand to 1.8 ksf at the bottom. Equivalent unit tip resistance is calculated as the sum of end bearing resistance for the pipe plus side resistance on the interior of the pipe, divided by the pile cross-sectional area (for the wall only, excluding the inside of the pipe). For the loam, the equivalent unit tip resistance is 194 ksf. For the sand, the equivalent unit tip resistance varies from 634 ksf at the top of sand to 1028 ksf at the bottom of sand.

Quake and damping values are shown in the table below and are consistent with GRLWEAP recommendations.

Soil Type	Skin Quake, in.	Toe Quake, in.	Skin Damping, s/ft	Toe Damping, s/ft
Loam (Clayey Silt)	0.1	0.1	0.15	0.15
Dense Sand	0.1	0.1	0.05	0.15

Project Big Muddy Slide Stabilization
DBA Project No. 23-163
Performed by AZB Date 6/19/2024
Reviewed by DSG Date 6/19/2024

Perform the analysis with a Delmag D46 hammer. Use the recommended driving system for a 42-inch steel pipe pile (the largest system available in GRLWEAP). Use the “driveability” analysis option in GRLWEAP.

Results

As shown below, driving to the bottom of the sand layer requires 6.7 blows/inch, which is less than refusal. The resulting compressive stress in the pile is 21 ksi, which is acceptable at approximately 42% of the yield stress.
