GENERAL NOTES

THE THICKNESS OF BITUMINOUS MIXTURE SHOWN ON THE PLANS IS THE NOMINAL THICKNESS. DEVIATIONS FROM THE NOMINAL THICKNESS WILL BE PERMITTED WHEN SUCH DEVIATIONS OCCUR DUE TO IRREGULARITIES IN THE EXISTING SURFACE OR BASE ON WHICH THE BITUMINOUS MIXTURE IS PLACED.

FACTORS USED FOR QUANTITY CALCULATIONS ARE AS FOLLOWS:
ALL BITUMINOUS CONCRETE - - - - - - - - - 2.016 TONS/CU. YD.

AT ALL LOCATIONS WHERE BITUMINOUS OR CONCRETE PAVEMENT JOINS AN EXISTING BITUMINOUS OR CONCRETE PAVEMENT, A SAWED JOINT SHALL BE CONSTRUCTED. THE COST OF THIS JOINT WILL BE INCIDENTAL TO THE TYPE OF PAVEMENT BEING CONSTRUCTED.

EXISTING PIPE UNDERDRAIN OUTLETS IN THE MEDIAN SHALL BE PRESERVED AND PROTECTED DURING CONSTRUCTION. ANY DAMAGE TO AN UNDERDRAIN OUTLET RESULTING FROM CONSTRUCTION ACTIVITY SHALL BE REPAIRED AT THE CONTRACTOR'S EXPENSE. IN AREAS WHERE MEDIAN SLOPES ARE TO BE FLATTENED, IT MAY BE NECESSARY TO LENGTHEN EXISTING PIPE DRAINS. IF THIS OCCURS, THE WORK SHALL BE DONE AS DIRECTED BY THE ENGINEER AND PAID FOR IN ACCORDANCE WITH ARTICLE 109.04 OF THE STANDARD SPECIFICATIONS.

UNLESS OTHERWISE NOTED IN THE PLANS, PROPOSED GUARDRAIL WILL BE TAPERED FROM THE BRIDGE PARAPETS AT A RATIO OF 30:1.

THE QUANTITIES FOR BITUMINOUS SHOULDER REMOVAL AND BITUMINOUS SHOULDERS SHOWN IN THE PLANS ARE ONLY ESTIMATES. THE ACTUAL QUANTITIES REQUIRED FOR REPAIR OF SHOULDERS DAMAGED DURING REMOVAL OF THE MEDIAN CROSS-OVER PAVEMENT, AND FOR REPAIR OF DAMAGE TO THE OUTSIDE SOUTHBOUND SHOULDER CAUSED BY TRAFFIC TO THE EXIT RAMP AT THE REST AREA NEAR GUN CREEK, SHALL BE AS DETERMINED BY THE ENGINEER.

A 4' WIDE STRIP OF CROSS-OVER PAVEMENT ADJACENT TO THE EXISTING MAINLINE PAVEMENT SHALL REMAIN IN PLACE AS BITUMINOUS SHOULDER AT EACH END OF EACH MEDIAN CROSS-OVER. SEE THE SPECIAL PROVISION FOR "CROSS-OVER PAVEMENT TO BE USED AS BITUMINOUS SHOULDER".

FOR THE PURPOSE OF THIS CONTRACT, EARTHWORK COMPACTION WILL BE TO THE SATISFACTION OF THE ENGINEER.

THERE ARE NO STUD SHEAR CONNECTORS IN THE EXISTING BRIDGE DECKS.

THE QUANTITY SHOWN IN THE PLANS FOR WOVEN WIRE FENCE TO BE REMOVED AND RE-ERECTED IS BASED ON AN ESTIMATED 5 LINEAL FEET AT EACH OF THE WEST WINGWALLS AT EACH OF THE FOUR BRIDGE DECK REPLACEMENT LOCATIONS. THE ACTUAL QUANTITY WILL BE AS DIRECTED BY THE ENGINEER.

Bench Mark: Top of ½" bolt imbedded in the S.E. corner of the east handrail on the southbound lane of the Gun Creek Bridge. Elev. 419.91

Existing structure: 028-0014 S.B. Built as F.A.I. Route 57 28-1B-F in 1962.
The superstructure consists of R.C. deck supported on 3 span continuous W.F. beams.
Temporary median cross-overs shall be utilized to divert traffic over adjacent bridge (028-0013 N.B.) during reconstruction.

STATE OF ILLINOIS
DEPARTMENT OF TRANSPORTATION

PROFILE GRADE
(F.A.I. 57 along ℄ pavement)

Traffic Barrier Terminal Std. 2341 Type 6 (typ. - approach end only)

Removal of Existing Bit. Appr. Shldr.Pav't. included in Rdwy. Plan. (Typ. all locations)

NOTE: Only the Southbound Structure is included in the Contract.

GENERAL NOTES

Fasteners shall be high strength bolts. Bolts ¾"φ. Open holes ⅞"φ, unless otherwise noted.

Field welding of construction accessories will not be permitted to the bottom flange of beams nor to the top flange for a distance equal to one-fourth the span length each way from the pier supports. Field welding in other areas will be permitted only when approved by the Engineer.

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

Plan dimensions and details relative to existing structure have been taken from existing plans and Field Survey Elevations and are subject to nominal construction variations. It shall be the Contractor's responsibility to verify such dimensions and details in the field and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in the scope of the work, however, the contractor will be paid for the quantity actually furnished of the unit price bid for the work.

The Contractor will be required to mark on top of the concrete deck, the locations of the top flange of all the steel beams, prior to any removal of the bridge concrete deck. Saw cutting directly over the top of the beam flanges is not permitted.

All top surfaces of the abutment seat area shall receive "Bridge Seat Sealer."

The Zinc-Silicate Primer Paint System shall be used for shop painting of new structural steel. The color of the vinyl finish coat shall be Munsell Std. 10Y 7/1 light grey.

Prior to pouring the new concrete for the deck, all loose rust, loose mill scale, and all other foreign material shall be removed from the embedded portions of flanges of stringers. The removal shall be accomplished in accordance with the requirements of the SSPC Surface Preparation Specifications SP-3 for power tool cleaning or SP-2 for hand tool cleaning. Cost shall be incidental to Removal of Existing Concrete Deck.

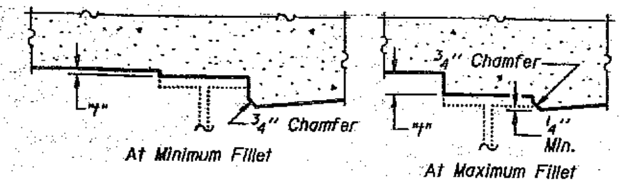
DEAD LOAD DEFLECTION DIAGRAM

(Includes weight of concrete only)

Note: The above deflections are not to be used in the field if the engineer is working from the grade elevations adjusted for dead load deflections as shown on Sheet #3 of 16.



To determine "t": After all structural steel has been erected, elevations of the top flanges of the beams shall be taken at intervals shown below. These elevations subtracted from the "Theoretical Grade Elevations Adjusted for Dead Load Deflection" shown on Sheet #3 of 16, minus slab thickness, equals the fillet heights "t" above top flange of beams.

DETAIL "B"

** Furnish in segments of 20 ft. maximum length. Maximum space between installed segments shall be ½". Seal space with Silicone Sealant suitable for Structural Steel.

Notes: After fabrication all surfaces of the steel plates shall be given one shop coat of paint specified for Structural Steel. No field painting required.

* Existing vertical Reinforcement in the back wall and the longitudinal reinforcement in the approach slab shall be cleaned and straightened and incorporated into new construction. Cost incidental to "Concrete Removal."

Imp.	(K)	9.2	10.8
R (Total)	(K)	64.2	108.9

* Service Load Values.

Is and Ss are the moment of inertia and section modulus of the steel section used in computing fs (Total).

Ic and Sc are the moment of inertia and section modulus of the composite section used in computing fs (Total).

VR is the maximum live Load + Impact shear range in span.

M (Total) = $Ms_{DL} + (M_{LL} + I)$

fs (Total) is the sum of the stresses due to $[M_{DL} + Ms_{DL} + (M_{LL} + I)]$.

M_{DL} is the Moment due to Dead Loads on non-composite section.

Ms_{DL} is the Moment due to Dead Loads on composite section.

M_{LL} is the Moment due to Live Loads on non-composite or composite section.

I is the Live Load Impact.

SECTION C-C

JACK AND REMOVE EXISTING BEARING PROCEDURE

1. The Contractor shall submit for approval by the Engineer, plans for jacking prior to commencing any work at the bearings. Dead Load = 3.8K at each beam at abutments and 7.5K at each beam at piers without concrete deck. Jack Capacity = 8 Tons min.
2. Jacking and removing existing bearings shall be done after deck removal is completed and before the new deck is poured.
3. All beams at one abutment or at one pier shall be lifted simultaneously.
4. Jacking shall be limited to a maximum of ¼" lift.
5. The existing anchor bolts shall be removed or cut off flush and ground smooth with the bridge seat. The rockers and bottom plates shall be removed leaving the existing top plate intact. The existing holes shall be filled with concrete and new holes drilled at locations specified.
6. The new elastomeric bearings and steel extensions shall be placed and the jacks shall be lowered before the new deck is poured.

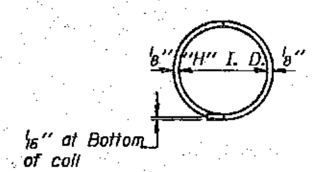
ILLINOIS COIL-LOCK ANCHOR BOLT



PLAN-COIL WIRE

MATERIALS FOR ILLINOIS COIL-LOCK ANCHOR BOLT

The anchor bolt shall be fabricated from cold drawn or hot finished seamless carbon steel mechanical tubing conforming to ASTM A519, Grade 1026 and supplied with hexagonal nuts and cut washers.
The coil wire shall be made of any suitable soft steel wire.
The finished anchor bolt shall be cleaned of rust and other foreign materials and wrapped or packaged to prevent contamination until they are installed.
The epoxy grout shall be a two-component, epoxy resin bonding system conforming to ASTM C881, Type I, Grade 1 and of a Class suitable for the temperature at installation.

INSTALLATION PROCEDURE for the ILLINOIS COIL-LOCK ANCHOR BOLT

1. With the coil wire in place, the bolt shall be inserted into the hole and turned clockwise to a snug fit in the hole. Nut and washer shall be placed on the bolt. The nut shall be tensioned until the steel base plates are held securely to the concrete bearing seat.
2. Epoxy grout shall be pumped through the zerk fitting with a pressure gun. Pumping shall continue until the epoxy overflows the hole around the bolt shank. After pumping is discontinued, excess epoxy shall be immediately wiped off.

ALTERNATE ANCHOR BOLTS

The Contractor may use, at his option, the capsule or the adhesive cartridge type anchor rods that have been previously tested and given a prior approval by the Department. The Contractor shall install these anchor rods in pre-drilled holes in accordance with the manufacturer's recommendations and procedures.
The capsule or the adhesive cartridge type anchor rods shall be a two part system composed of:
1. A threaded rod stud with nut and washer conforming to ASTM A307.
2. A sealed glass capsule or a sealed glass adhesive cartridge containing premeasured amounts of the adhesive chemical.

GENERAL NOTES

Holes in the masonry for anchor bolts shall be drilled through the base plates to the diameter and depth shown or in accordance with the manufacturer's recommendation after beams or girders have been erected and adjusted.
Prior to setting the bolts, the holes shall be dry and all dust and loose particles shall be removed by the use of compressed air or vacuuming.
The anchor bolts, furnished and installed and including the epoxy grout or capsules shall not be paid for separately but shall be included in the unit bid price for "Furnishing and Erecting Structural Steel".

MARCUM BRANCH

Existing Structures: #028-0011 (S.B.) & #028-0012 (N.B.) are each 127'-6" long and 42'-0" wide. Built as F.A.I. Rte. 57, Section 28-2B at Sta. 304+25 in 1962 consists of RC Deck supported on 3 span continuous wide flange beams.
Temporary median crossovers shall be utilized to divert traffic over adjacent bridge during reconstruction.
Bench Mark: Cut on top of N.E. end of West handrail of Southbound Lane of bridge over Marcum Branch. Elevation 424.81.
No Salvage.

SHEET NO. 1 / 16 SHEETS

GENERAL NOTES

Fasteners shall be high strength bolts. Bolts ⅞"ϕ, open holes $^{15}/_{16}$"ϕ, unless otherwise noted.

Field welding of construction accessories will not be permitted to the bottom flange of beams nor to the top flange for a distance equal to one-fourth the span length each way from the pier supports. Field welding in other areas will be permitted only when approved by the Engineer.

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

Plan dimensions and details relative to existing structure have been taken from existing plans and field survey and are subject to nominal construction variations. It shall be the Contractor's responsibility to verify such dimensions and details in the field and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in the scope of the work, however, the Contractor will be paid for the quantity actually furnished at the unit price bid for the work.

Two ⅛" adjusting shims, of the dimensions of the bottom bearing plate, shall be provided for each bearing in addition to all other plates or shims. For Type I Elastomeric Bearings, shims of the dimensions of the top plate shall be provided and placed as detailed.

The Contractor will be required to mark, on top of the concrete deck, the locations of the top flange of all the steel beams, prior to any removal of the bridge concrete deck. Saw cutting directly over the top of the beam flanges is not permitted.

Bearing seat surfaces of the abutments shall receive Bridge Seat Sealer.

The zinc-silicate primer shall be used for shop painting of new structural steel.

Prior to pouring the new concrete for the deck, all loose rust, loose mill scale and all other foreign material shall be removed from the embedded portions of flanges of stringers. The removal shall be accomplished in accordance with the requirements of the SSPC Surface Preparation Specifications SP-3 for power tool cleaning or SP-2 for hand tool cleaning. Cost shall be incidental to "Removal of Existing Concrete Deck"

For cantilever forming brackets see Special Provisions.

SHEET NO. 2
16 SHEETS

To determine "t": After all structural steel has been erected, elevations of the top flanges of the beams shall be taken at intervals shown below. These elevations subtracted from the "Theoretical Grade Elevations Adjusted for Dead Load Deflection" shown below, minus slab thickness, equals the fillet heights "t" above top flange of beams.

Is and Ss are the moment of inertia and section modulus of the steel section used in computing fs (Total).

Ic and Sc are the moment of inertia and section modulus of the composite section used in computing fs (Total).

VR is the maximum live Load + Impact shear range in span.

JACK AND REMOVE EXISTING BEARING

Hatched areas indicate Removal of Existing Bearing.
See sheets #8, #9 & #10 of 16 for new brg. details.

JACK AND REMOVE EXISTING BEARING PROCEDURE

1. The Contractor shall submit for approval by the Engineer, plans for jacking prior to commencing any work at the bearings. Dead Load = 3.0K at each beam at abutments and 6.0K at each beam at piers without concrete. Min. Jack Capacity at each beam shall be 5 Tons.
2. Jacking and removing existing bearings shall be done after deck removal is completed and before the new deck is poured.
3. All beams at one abutment or at one pier shall be lifted simultaneously.
4. Jacking shall be limited to a maximum of ¼".
5. Remove the existing anchor bolts flush with the concrete surface and grind smooth. The rockers and bottom plates shall be removed, leaving the existing top plate intact.
6. The new bearings and steel extensions shall be installed in place and the jacks shall be lowered before the new deck is poured.

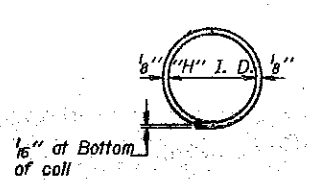
ILLINOIS COIL-LOCK ANCHOR BOLT



PLAN-COIL WIRE

MATERIALS FOR ILLINOIS COIL-LOCK ANCHOR BOLT

The anchor bolt shall be fabricated from cold drawn or hot finished seamless carbon steel mechanical tubing conforming to ASTM A519, Grade 1026 and supplied with hexagonal nuts and cut washers.

The coil wire shall be made of any suitable soft steel wire.

The finished anchor bolt shall be cleaned of rust and other foreign materials and wrapped or packaged to prevent contamination until they are installed.

The epoxy grout shall be a two-component, epoxy resin bonding system conforming to ASTM C881, Type I, Grade 1 and of a Class suitable for the temperature at installation.

INSTALLATION PROCEDURE for the ILLINOIS COIL-LOCK ANCHOR BOLT

1. With the coil wire in place, the bolt shall be inserted into the hole and turned clockwise to a snug fit in the hole. Nut and washer shall be placed on the bolt. The nut shall be tensioned until the steel base plates are held securely to the concrete bearing seat.
2. Epoxy grout shall be pumped through the zerk fitting with a pressure gun. Pumping shall continue until the epoxy overflows the hole around the bolt shank. After pumping is discontinued, excess epoxy shall be immediately wiped off.

ALTERNATE ANCHOR BOLTS

The Contractor may use, at his option, the capsule or the adhesive cartridge type anchor rods that have been previously tested and given a prior approval by the Department. The Contractor shall install these anchor rods in pre-drilled holes in accordance with the manufacturer's recommendations and procedures.

The capsule or the adhesive cartridge type anchor rods shall be a two part system composed of:

1. A threaded rod stud with nut and washer conforming to ASTM A307.
2. A sealed glass capsule or a sealed glass adhesive cartridge containing premeasured amounts of the adhesive chemical.

GENERAL NOTES

Holes in the masonry for anchor bolts shall be drilled through the base plates to the diameter and depth shown or in accordance with the manufacturer's recommendation after beams or girders have been erected and adjusted.

Prior to setting the bolts, the holes shall be dry and all dust and loose particles shall be removed by the use of compressed air or vacuuming.

The anchor bolts, furnished and installed and including the epoxy grout or capsules shall not be paid for separately but shall be included in the unit bid price for "Furnishing and Erecting Structural Steel".

GENERAL NOTES

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

Traffic control shall be determined by the District.

Prior to pouring the new concrete for the deck, all loose rust, loose mill scale, and all other foreign material shall be removed from the embedded portions of flanges of girders. The removal shall be accomplished in accordance with the requirements of the SSPC Surface Preparation Specifications SP3 for Power Tool Cleaning or SP2 for Hand Tool Cleaning. Cost shall be incidental to Concrete Removal.

Plan dimensions and details relative to existing structure have been taken from existing plans and are subject to nominal construction variations. It shall be the Contractor's responsibility to verify such dimensions and details in the field and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in the scope of the work, however, the Contractor will be paid for the quantity actually furnished at the unit price bid for the work.

The first bridge Post and Insert at each corner shall be removed, cleaned and reinstalled in new construction. Cost incidental to "Concrete Removal".

Joint Size	"C" at 50°F	"D" at 50°F
2"	2"	1½" Min.
2½"	2½"	1¾" Min.
4"	3"	2½" Min.

INSTALLATION NOTES

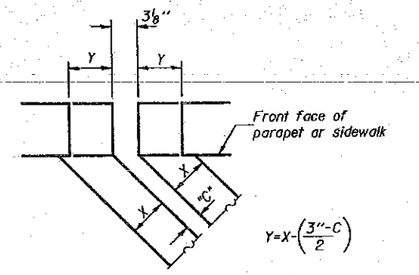
1. Install sponge mandrels into positions shown to form flap convolution.
2. Install parapet or sidewalk piece (trim roadway flap to fit before applying epoxy).
3. Install continuous seal in roadway.
4. Install anchor blocks as indicated.

NOTE A: Maximum spacing of anchor bolts shall be 12" centers.

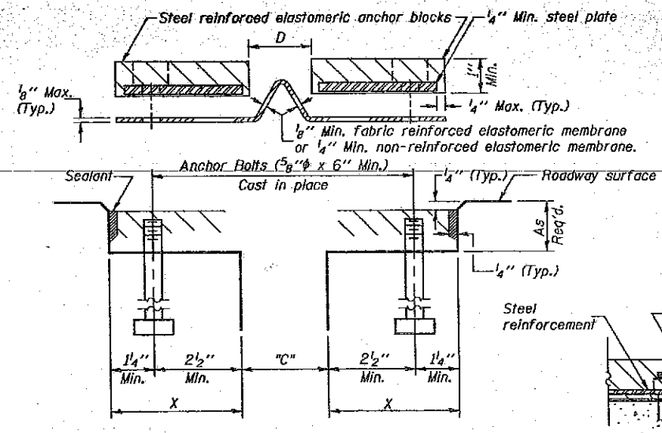
SKEW LIMITATIONS

The details of the anchor blocks and the elastomeric membrane in the parapet, as shown, are for up to 50° skews.

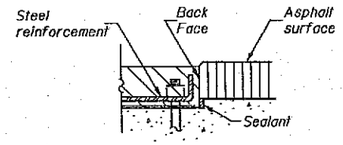
For skews greater than 50°, the anchor blocks and the elastomeric membrane, installed in accordance with dimension "D", might require modifications to insure a minimum clearance of 1½" from centerline of anchor studs to edge of parapet opening. The anchor blocks and the elastomeric membrane shall also be installed to the top of the parapet with the anchor studs spaced at ±12" cts.



FORMING BLOCKOUT SKETCH



CROSS SECTION



ANCHOR BLOCK REINFORCEMENT WITH ASPHALT SURFACE

GENERAL NOTES

Continuous Seal Neoprene Expansion Joint shall consist of molded anchor blocks of elastomer and steel, field assembled over continuous lengths of elastomeric membrane.

The elastomeric membrane shall be premolded with a single or a double upward convolution that will have a "memory" to return to its molded position upon joint closure.

The steel reinforcement must extend up the back face of anchor blocks when asphalt surfaces are used but is optional in concrete blockout.

The convolution length shall be such that the extended length will not be greater than the manufactured length when the joint is fully expanded in its design range and will not protrude above the anchor blocks when the joint is fully compressed.

Joint openings shall be adjusted in accordance with Article 503.07(c) of the Standard Specifications when the deck is poured at an ambient temperature other than 50° F.

The parapet and sidewalk flaps may be furnished factory vulcanized to the roadway membrane provided the centerline of the convolution is maintained and the process and method meet the approval of the Engineer.

MIDDLE FORK BIG MUDDY RIVER

Bench Mark: "□" Cut in N.E. handrail on the N.E. corner of Middle Fork of Big Middy River bridge - Southbound Lanes. Sta. 44+49.00 Elevation 395.13.
Existing Structure: 028-0007 (SB). Built as FAI Route 57, Sec. 28-5(B-F) in 1962. The superstructure consists of 5 spans of continuous WF beams with an R.C. deck. The bridge will be rehabilitated in accordance with the scope of work shown below.
Temporary median crossovers shall be utilized to divert traffic over adjacent bridge (028-0006 N.B.) during reconstruction. No salvage.

GENERAL NOTES

Fasteners shall be high strength bolts . Bolts $\frac{7}{8}$"ϕ. open holes $\frac{15}{16}$"ϕ. unless otherwise noted.

Calculated weight of Structural Steel M270 Gr. 50 = 51,230 Lbs.

Calculated weight of Structural Steel M270 Gr. 36 = 18,210 Lbs.

Field welding of construction accessories will not be permitted to the bottom flange of beams nor to the top flange for a distance equal to one-fourth the span length each way from the pier supports. Field welding in other areas will be permitted only when approved by the Engineer.

Anchor bolts shall be set before bolting diaphragms over supports.

The main load carrying member components subject to tensile stress shall conform to the Supplemental Requirements for Notch Toughness Zone 2. These Components are the wide flange beams and all splice plate material of the wide flange beams.

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

All top surfaces of the Abutments shall receive "Bridge Seat Sealer".

The contractor shall drive 2 (two) Steel HP12 x 53 test piles in permanent locations 1 (one) at the North Abutment and 1 (one) at South Abutment as directed by the Engineer before ordering the remainder of the piles.

The Zinc-silicate and vinyl paint system shall be used for shop and field painting of New Structural Steel. The color of the vinyl finish coat shall be Munsell No. 7.5 G 4/8. Interstate Green.

Plan dimensions and details relative to existing structure have been taken from existing plans and field survey elevations and are subject to nominal construction variations. It shall be the Contractor's responsibility to verify such dimensions and details in the field and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in the scope of the work, however, the contractor will be paid for the quantity actually furnished at the unit price bid for the work.

Bearing seat surfaces shall be constructed or adjusted to the designated elevations within a tolerance of $\frac{1}{8}$ inch. Adjustment shall be made either by grinding the surface or by shimming the bearing. Two $\frac{1}{8}$" adjusting shims, of the dimensions of the bottom bearing plate, shall be provided for each bearing in addition to all other plates or shims. For Type I Elastomeric Bearings, shims of the dimensions of top plate shall be provided and placed as detailed.

The Contractor will be required to mark, on top of the concrete deck, the locations of the top flange of all the steel beams, prior to any removal of the bridge concrete deck. Saw cutting directly over the top of the beam flanges is not permitted.

Prior to pouring the new concrete for the deck, all loose rust, loose mill scale and all other foreign material shall be removed from the embedded portions of flanges of stringers. The removal shall be accomplished in accordance with the requirements of the SSPC Surface Preparation Specifications SP-3 for Power Tool Cleaning or SP-2 for hand tool cleaning. Cost shall be incidental to "Removal of Existing Concrete Deck".

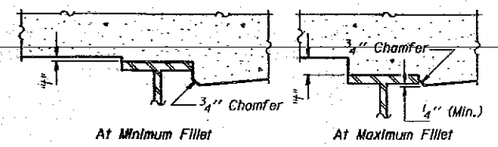
DEAD LOAD DEFLECTION DIAGRAM

(Includes weight of concrete only)

Note: The above deflections are not to be used in the field if the engineer is working from the grade elevations adjusted for dead load deflections as shown below and on sheets #3 & #5 of 25.



To determine "I": After all structural steel has been erected, elevations of the top flanges of the beams shall be taken at intervals shown on sheets #3, #4 & #5 of 25. These elevations subtracted from the "Theoretical Grade Elevations Adjusted for Dead Load Deflection" shown on sheets #3, #4 & #5 of 25, minus slab thickness, equals the fillet heights "I" above top flange of beams.

Reinforcement bars designated (E) shall be epoxy coated.

Bars indicated thus 1 x 2-#5 etc. indicates 1 line of bars with 2 lengths per line.

Notes:

The exterior surfaces of the Floor Drain shall be painted with the vinyl enamel coat painting specified for Structural Steel. The exterior surfaces of the Drain shall be cleaned and given a washcoat pretreatment in accordance with Steel Structures Painting Council's Spec. SSPC-SP1 & SSPC-Paint 27 prior to painting.

Fiberglass pipe shall conform to ASTM: D2996, with short-time rupture strength hoop tensile stress of 30,000 p.s.i. minimum. The surface of the Fiberglass pipe shall be free of bond inhibiting agents.

Joint Size	"C" at 50°F	"D" at 50°F
2"	2"	1½" Min.
2½"	2½"	1¾" Min.
4"	3"	2½" Min.

INSTALLATION NOTES

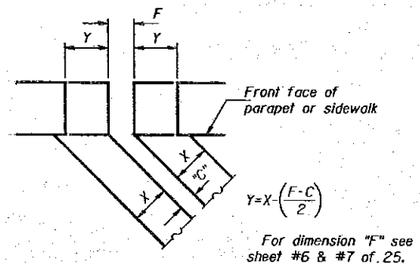
1. Install sponge mandrels into positions shown to form flap convolution.
2. Install parapet or sidewalk piece (trim roadway flap to fit before applying epoxy).
3. Install continuous seal in roadway.
4. Install anchor blocks as indicated.

NOTE A: Maximum spacing of anchor bolts shall be 12" centers.

SKEW LIMITATIONS

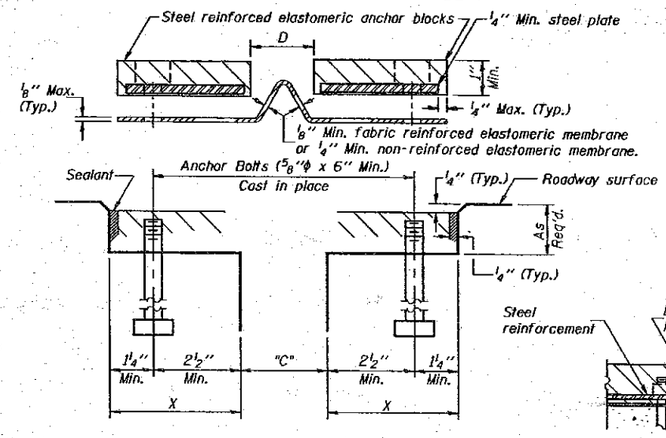
The details of the anchor blocks and the elastomeric membrane in the parapet, as shown, are for up to 50° skews.

For skews greater than 50°, the anchor blocks and the elastomeric membrane, installed in accordance with dimension "D", might require modifications to insure a minimum clearance of 1½" from centerline of anchor studs to edge of parapet opening. The anchor blocks and the elastomeric membrane shall also be installed to the top of the parapet with the anchor studs spaced at ±12" cts.

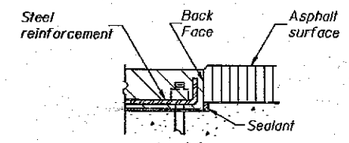


For dimension "F" see sheet #6 & #7 of 25.

FORMING BLOCKOUT SKETCH



CROSS SECTION



ANCHOR BLOCK REINFORCEMENT WITH ASPHALT SURFACE

GENERAL NOTES

Continuous Seal Neoprene Expansion Joint shall consist of molded anchor blocks of elastomer and steel, field assembled over continuous lengths of elastomeric membrane.

The elastomeric membrane shall be premolded with a single or a double upward convolution that will have a "memory" to return to its molded position upon joint closure.

The steel reinforcement must extend up the back face of anchor blocks when asphalt surfaces are used but is optional in concrete blockout.

The convolution length shall be such that the extended length will not be greater than the manufactured length when the joint is fully expanded in its design range and will not protrude above the anchor blocks when the joint is fully compressed.

Joint openings shall be adjusted in accordance with Article 503.07(c) of the Standard Specifications when the deck is poured at an ambient temperature other than 50° F.

The parapet and sidewalk flaps may be furnished factory vulcanized to the roadway membrane provided the centerline of the convolution is maintained and the process and method meet the approval of the Engineer.

PROCEDURE FOR JACKING AND REMOVING OF EXISTING BEARINGS

The Contractor shall submit plans for Jacking and Cribbing, to the Engineer for approval, prior to commencing any work at the Bearings.

Jacking and Removing Existing Bearings shall be done after existing deck removal is completed and before new deck is poured.

All Beams all locations to be lifted simultaneously

The maximum dead load reaction with deck removed (per bearing) at each Abutment is 5.0 kips and 16.5 kips at each Pier.

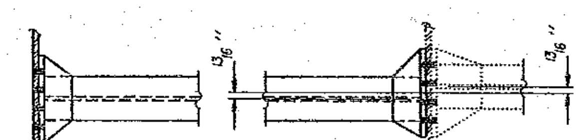
Jacking shall be limited to a maximum $\frac{1}{4}$" lift to remove the Existing Bearing Assembly.

The Jack capacity for each beam is 5 Tons at Abutments and 20 Tons at Piers. Set Jacks so that Beams can be lowered up to 2" from original position.

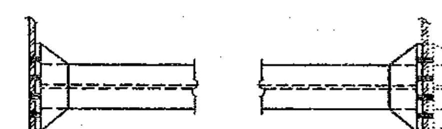
The bottom flange area of the Beam and Existing Top Plate shall be cleaned and painted as required and specified for Structural Steel.

The new Bearings and Steel Extensions shall be in place and the Jacks shall be lowered before the new concrete Deck is poured. Lower all Beams simultaneously in $\frac{1}{4}$" increments.

The new Beam shall be installed after the replacement of the existing bearings.

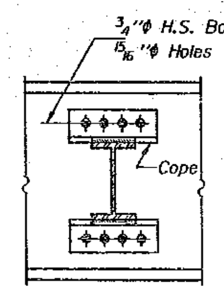


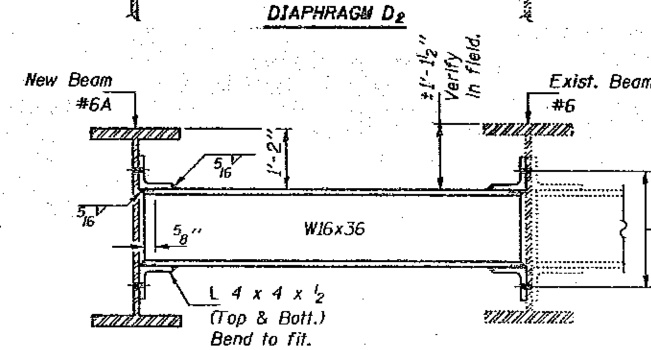
DIAPHRAGM D_1



DIAPHRAGM D_2

Note: Two hardened washers shall be required over all $\frac{15}{16}$"ϕ holes.





Remove existing rivets or bolts. Field drill $\frac{15}{16}$"ϕ holes in new angles using holes in existing beams as a template. Existing bolts and rivets are to be replaced by $\frac{3}{4}$"ϕ H.S. Bolt. Cost of Rivet and Bolt Removal and Field Drilling is incidental to "Structural Steel".

The Illinois Coil-Lock Anchor Bolt is a proprietary item which is the property of the Illinois Department of Transportation. Use, reproduction or disclosure without express written permission is prohibited and protected under Federal copyright laws. The production and the fabrication of this bolt for use on highway projects in the State of Illinois shall be permitted and there shall be no incurred charges or fees to the manufacturer or the fabricator for producing or fabricating this bolt.

PLAN-COIL WIRE

ILLINOIS COIL-LOCK ANCHOR BOLT

STATE OF ILLINOIS
DEPARTMENT OF TRANSPORTATION

MATERIALS FOR ILLINOIS COIL-LOCK ANCHOR BOLT

The anchor bolt shall be fabricated from cold drawn or hot finished seamless carbon steel mechanical tubing conforming to ASTM A519, Grade 1026 and supplied with hexagonal nuts and cut washers.

The coil wire shall be made of any suitable soft steel wire.

The finished anchor bolt shall be cleaned of rust and other foreign materials and wrapped or packaged to prevent contamination until they are installed.

The epoxy grout shall be a two-component, epoxy resin bonding system conforming to ASTM C881, Type I, Grade 1 and of a Class suitable for the temperature at installation.

INSTALLATION PROCEDURE for the ILLINOIS COIL-LOCK ANCHOR BOLT

1. With the coil wire in place,the bolt shall be inserted into the hole and turned clockwise to a snug fit in the hole. Nut and washer shall be placed on the bolt. The nut shall be tensioned until the steel base plates are held securely to the concrete bearing seat.
2. Epoxy grout shall be pumped through the zerk fitting with a pressure gun. Pumping shall continue until the epoxy overflows the hole around the bolt shank. After pumping is discontinued, excess epoxy shall be immediately wiped off.

ALTERNATE ANCHOR BOLTS

The Contractor may use, at his option, the capsule or the adhesive cartridge type anchor rods that have been previously tested and given a prior approval by the Department. The Contractor shall install these anchor rods in pre-drilled holes in accordance with the manufacturer's recommendations and procedures.

The capsule or the adhesive cartridge type anchor rods shall be a two-part system composed of:

1. A threaded rod stud with nut and washer conforming to ASTM A307.
2. A sealed glass capsule or a sealed glass adhesive cartridge containing premeasured amounts of the adhesive chemical.

SHEET NO. 19
25 SHEETS

GENERAL NOTES

Holes in the masonry for anchor bolts shall be drilled through the base plates to the diameter and depth shown or in accordance with the manufacturer's recommendation after beams or girders have been erected and adjusted.

Prior to setting the bolts, the holes shall be dry and all dust and loose particles shall be removed by the use of compressed air or vacuuming.

The anchor bolts, furnished and installed and including the epoxy grout or capsules shall not be paid for separately but shall be included in the unit bid price for "Furnishing and Erecting Structural Steel".

PLAN

GENERAL NOTES

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

Traffic control shall be determined by the District.

Prior to pouring the new concrete for the deck, all loose rust, loose mill scale, and all other foreign material shall be removed from the embedded portions of flanges of girders. The removal shall be accomplished in accordance with the requirements of the SSPC Surface Preparation Specifications SP 3 for Power Tool Cleaning or SP2 for Hand Tool Cleaning. Cost shall be incidental to Concrete Removal.

Plan dimensions and details relative to existing structure have been taken from existing plans and are subject to nominal construction variations. It shall be the Contractor's responsibility to verify such dimensions and details in the field and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in the scope of the work, however, the Contractor will be paid for the quantity actually furnished at the unit price bid for the work.

The first bridge Post and Insert at each corner shall be removed, cleaned and reinstalled in new construction. Cost incidental to "Concrete Removal".

After fabrication all surfaces of the steel plates shall be given one shop coat of the zinc-silicate and vinyl paint system. Cost incidental to "Furnishing and Erecting Structural Steel".

TOTAL BILL OF MATERIAL

ITEM	UNIT	QUANITY
Concrete Removal	Cu. Yd.	20.4
Class X Concrete	Cu. Yd.	19.9
Reinforcement Bars, Epoxy Coated	Pound	2810
Preformed Joint Seal 4"	Lin. Ft.	165
Furnishing and Erecting Structural Steel	Pound	6360

NOTE: QUANTITIES IN THE ABOVE BILL OF MATERIAL ARE FOR BOTH BRIDGES.

GENERAL NOTES

Field welding of construction accessories will not be permitted to the bottom flange of beams nor to the top flange for a distance equal to one-fourth the span length each way from the pier supports. Field welding in other areas will be permitted only when approved by the Engineer.

For cantilever forming bracket, See Special Provisions.

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

Plan dimensions and details relative to existing structure have been taken from existing plans and field survey and are subject to nominal construction variations. It shall be the Contractor's responsibility to verify such dimensions and details in the field and make necessary approved adjustments prior to construction or ordering of materials. Such variations shall not be cause for additional compensation for a change in the scope of the work, however, the Contractor will be paid for the quantity actually furnished at the unit price bid for the work.

All beams shall be lowered $2\frac{1}{8}$" from original position. (See Sht. #8 of 16)

Two $\frac{1}{8}$" adjusting shims, of the dimensions of the bottom bearing plate, shall be provided for each bearing in addition to all other plates or shims. For Type I Elastomeric Bearings, shims of the dimensions of top plate shall be provided and placed as detailed.

The Contractor will be required to mark, on top of the concrete deck, the locations of the top flange of all the steel beams, prior to any removal of the bridge concrete deck. Saw cutting directly over the top of the beam flanges is not permitted.

All top surfaces of the abutments shall receive Bridge Seat Sealer.

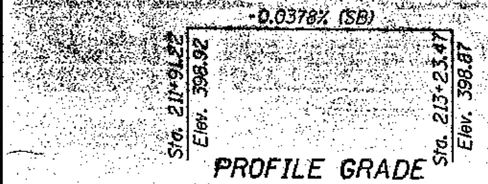
The zinc-silicate primer shall be used for shop painting of new Structural Steel.

Prior to Welding Studs and pouring the new concrete for the deck, all loose rust, loose mill scale and all other foreign material shall be removed from the embedded portions of flanges of stringers. The removal shall be accomplished in accordance with the requirements of the SSPC Surface Preparation Specifications SP-3 for power tool cleaning or SP-2 for hand tool cleaning. Cost shall be incidental to "Removal of Existing Concrete Deck".

TOTAL BILL OF MATERIAL

ITEM	UNIT	SUB	SUPER	TOTAL
Concrete Removal	Cu. Yd.		9	9
** Removal of Existing Concrete Deck	Each	1		1
Floor Drains	Each	14		14
Preformed Joint Seal $2\frac{1}{2}$"	Lin. Ft.	44		44
Preformed Joint Seal 4"	Lin. Ft.	44		44
Class X Concrete Superstructure	Cu. Yd.	187.1		187.1
*** Protective Coat	Sq. Yd.	690		690
Elastomeric Bearing Assembly, Type I	Each	14		14
Elastomeric Bearing Assembly, Type II	Each	7		7
Structural Steel	Lbs.	9,530		9,530
Stud Shear Connectors	Each	3,150		3,150
Reinforcement Bars, Epoxy Coated	Pound	44,150		44,150
Name Plates	Each	1		1
Bridge Seat Sealer	Sq. Ft.	177		177
Jack and Remove Existing Bearings	Each	28		28
Bridge Deck Grooving	Sq. Yd.	555		555
Structure Excavation	Cu. Yd.		22.0	22.0

** Cost includes removal of existing railing.
*** Quantity includes bridge deck surface.



PROFILE GRADE
F.A. Route 57 (along ℄ pavement) (South Bound Structure)

Note:
Only the South bound structure is included in this contract. North bound structure shown for information only.

DESIGN SPECIFICATIONS

1989 AASHTO with 1990 & 1991 Interims & Seismic Retrofitting Guidelines for Highway Bridges.

LOADING HS 20-44 & Alt.

Allow 25#/ sq. ft. for future wearing surface.

DESIGN STRESSES

FIELD UNITS
New Construction
f'_c = 3,500 psi
f_y = 60,000 psi (Reinf.)
f_y = 33,000 psi (Existing Structural Steel)
f_y = 36,000 psi (New Structural Steel)

To determine "I": After all structural steel has been erected, elevations of the top flanges of the beams shall be taken at intervals shown below. These elevations subtracted from the "Theoretical Grade Elevations Adjusted for Dead Load Deflection" shown below, minus slab thickness, equals the fillet heights "I" above top flange of beams.

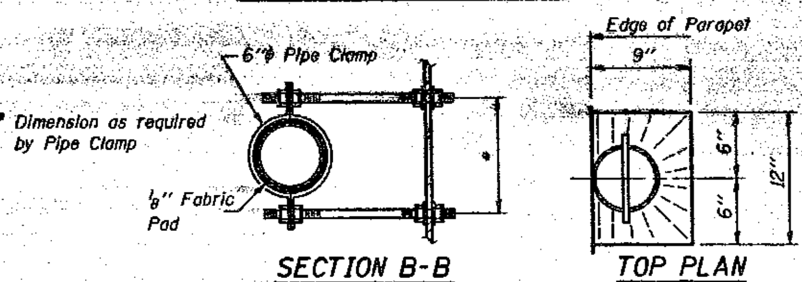
FIBERGLASS PIPE

ALUMINUM PIPE



Notes:
The exterior surfaces of the floor drain shall be painted with the vinyl enamel paint as specified in the Standard Specifications. The exterior surfaces of the drain shall be cleaned and given a washcoat pretreatment in accordance with Steel Structures Painting Council's Spec. SSPC-SP1 & SSPC-Paint 27 prior to painting.
Fiberglass pipe shall conform to ASTM: D2996, with short-time rupture strength hoop tensile stress of 30,000 p.s.i. minimum. The surface of the Fiberglass pipe shall be free of bond inhibiting agents.

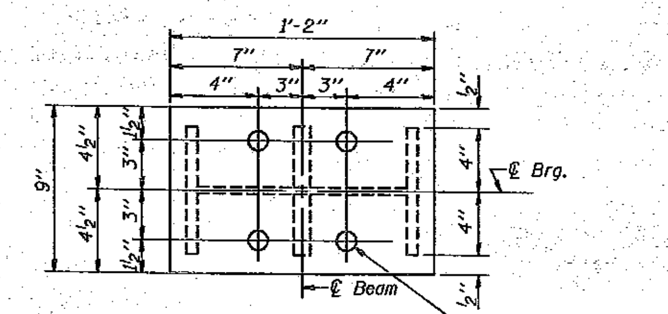
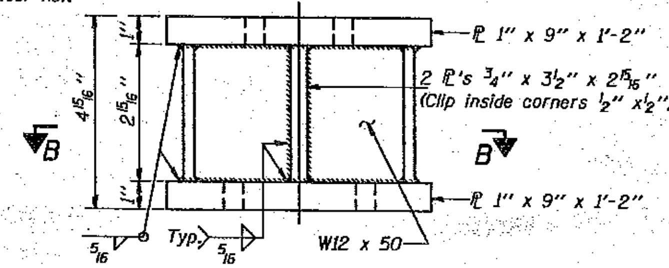
ELEVATION AT SOUTH ABUT.

SECTION A-A

TYPE II TFE ELASTOMERIC EXP. BRG.

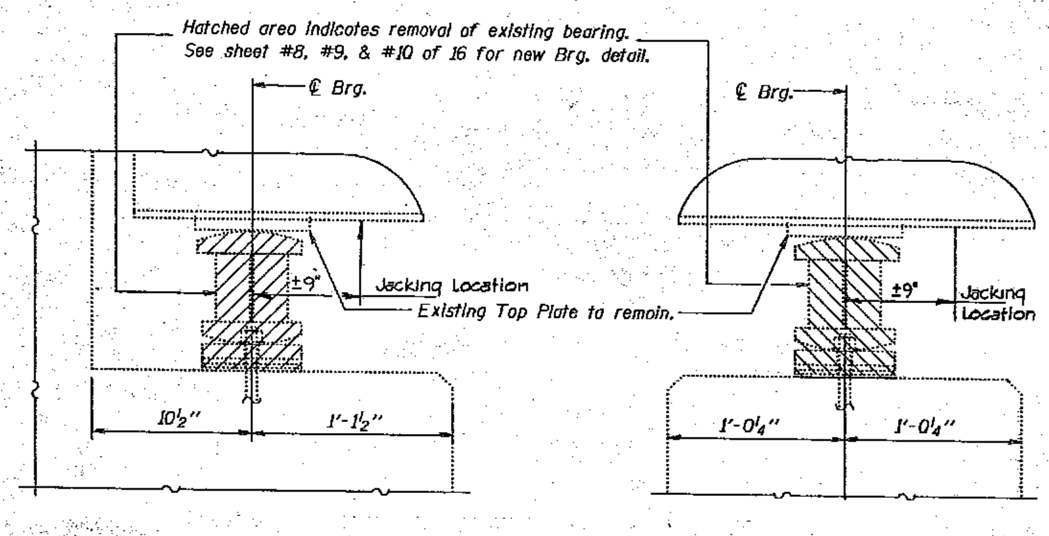


PLAN-TOP PLATE



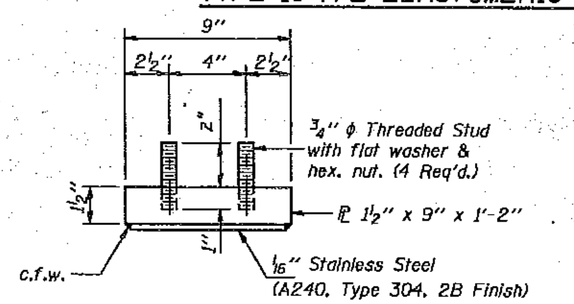
STEEL EXTENSION AT SOUTH ABUT.

Equivalent welded plates will be allowed in lieu of W12 x 50 section.

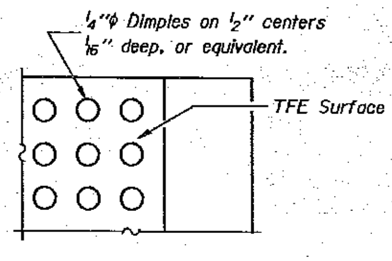


JACK AND REMOVE EXISTING BEARING

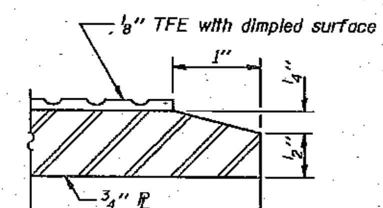
(Dimension are at Rt. L's)



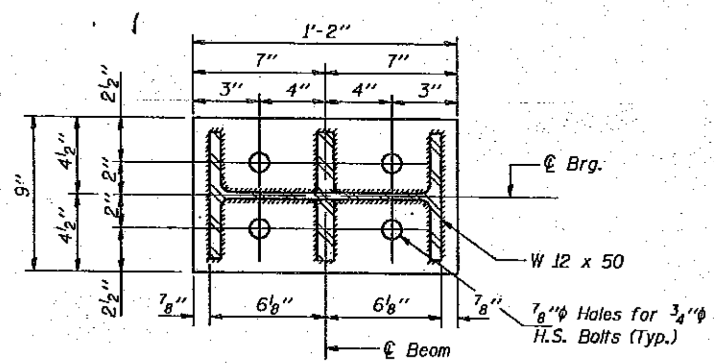
TOP BEARING ASSEMBLY



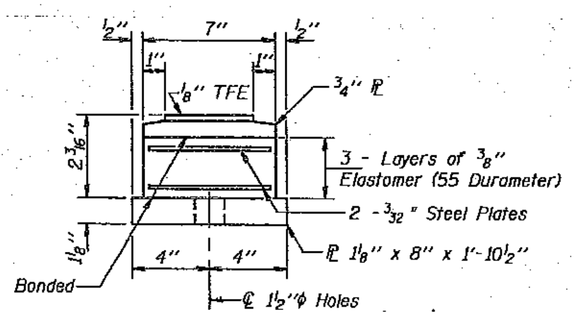
PLAN-TFE SURFACE



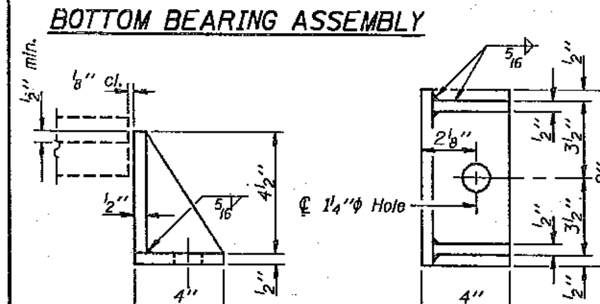
SECTION THRU TFE



SECTION B-B



BOTTOM BEARING ASSEMBLY

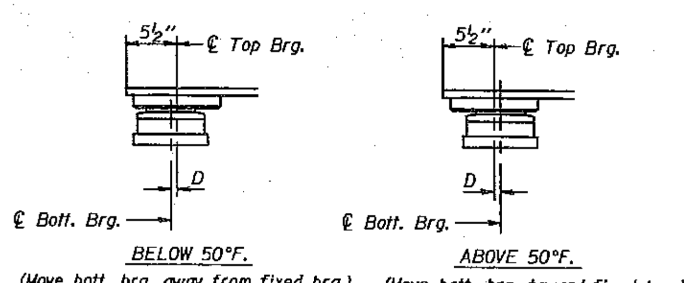


SIDE RETAINER

Equivalent rolled angle with stiffeners will be allowed in lieu of welded plates.

Note: The ⅛" TFE sheet shall be bonded directly to the top steel plate with a two-component, medium viscosity epoxy resin, conforming to the requirements of the Federal Specification MMM-A-134, Type I. The bond agent shall be applied on the full area of the contact surfaces.

Bonding of ⅛" TFE sheet during vulcanizing process will be permitted provided the process and method of adjusting assembly height is approved by the Engineer.



SETTING ANCHOR BOLTS AT EXP. BRG.

D=⅛" per each 100' of expansion for every 15° temp. change from the normal temp. of 50°F.

JACK AND REMOVE EXISTING BEARING PROCEDURE

1. The Contractor shall submit for approval by the Engineer, plans for jacking & cribbing prior to commencing any work at the bearings.
2. Jacking and removing existing bearings shall be done after deck removal is completed and before the new deck is poured.
3. All beams, all locations shall be lifted simultaneously.
4. Jacking shall be limited to a maximum of ¼" lift to remove the existing bearing assembly, utilizing a jack or series of jacks. The max. dead load reaction at each beam with the deck removed is 6.0K at Piers and 1.9K at Abutments. The Minimum Jack Capacity for each beam is 5 Ton at Piers and 2 Ton at Abutments. Set jacks so that beams can be lowered approximately 2⅛" from original position.
5. Remove the existing anchor bolts flush with the concrete surface and grind smooth. The rocker and bottom plates shall be removed leaving the existing top plate intact.
6. The new bearings and steel extensions shall be in place and the jacks shall be lowered before the new deck is poured. Lower all Beams simultaneously in ¼" increments.

Notes: For anchor bolt installation details see sheet #16 of 16.
- For table of Shim Plate "t" Dimensions see sheet #10 of 16.
- Anchor Bolts, Side Retainers, Shim Plates, Lead Plates, and Steel Extension Assemblies are included in the "Structural Steel" Quantity.
- See sheet #12 of 16 for anchor bolt layout at South Abutment.

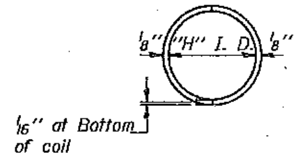
ILLINOIS COIL-LOCK ANCHOR BOLT



PLAN-COIL WIRE

MATERIALS FOR ILLINOIS COIL-LOCK ANCHOR BOLT

The anchor bolt shall be fabricated from cold drawn or hot finished seamless carbon steel mechanical tubing conforming to ASTM A519, Grade 1026 and supplied with hexagonal nuts and cut washers.

The coil wire shall be made of any suitable soft steel wire.

The finished anchor bolt shall be cleaned of rust and other foreign materials and wrapped or packaged to prevent contamination until they are installed.

The epoxy grout shall be a two-component, epoxy resin bonding system conforming to ASTM C881, Type I, Grade 1 and of a Class suitable for the temperature of installation.

INSTALLATION PROCEDURE for the ILLINOIS COIL-LOCK ANCHOR BOLT

1. With the coil wire in place, the bolt shall be inserted into the hole and turned clockwise to a snug fit in the hole. Nut and washer shall be placed on the bolt. The nut shall be tensioned until the steel base plates are held securely to the concrete bearing seat.
2. Epoxy grout shall be pumped through the zerk fitting with a pressure gun. Pumping shall continue until the epoxy overflows the hole around the bolt shank. After pumping is discontinued, excess epoxy shall be immediately wiped off.

ALTERNATE ANCHOR BOLTS

The Contractor may use, at his option, the capsule or the adhesive cartridge type anchor rods that have been previously tested and given a prior approval by the Department. The Contractor shall install these anchor rods in pre-drilled holes in accordance with the manufacturer's recommendations and procedures.

The capsule or the adhesive cartridge type anchor rods shall be a two part system composed of:

1. A threaded rod stud with nut and washer conforming to ASTM A307.
2. A sealed glass capsule or a sealed glass adhesive cartridge containing premeasured amounts of the adhesive chemical.

GENERAL NOTES

Holes in the masonry for anchor bolts shall be drilled through the base plates to the diameter and depth shown or in accordance with the manufacturer's recommendation after beams or girders have been erected and adjusted.

Prior to setting the bolts, the holes shall be dry and all dust and loose particles shall be removed by the use of compressed air or vacuuming.

The anchor bolts, furnished and installed and including the epoxy grout or capsules shall not be paid for separately but shall be included in the unit bid price for "Furnishing and Erecting Structural Steel".

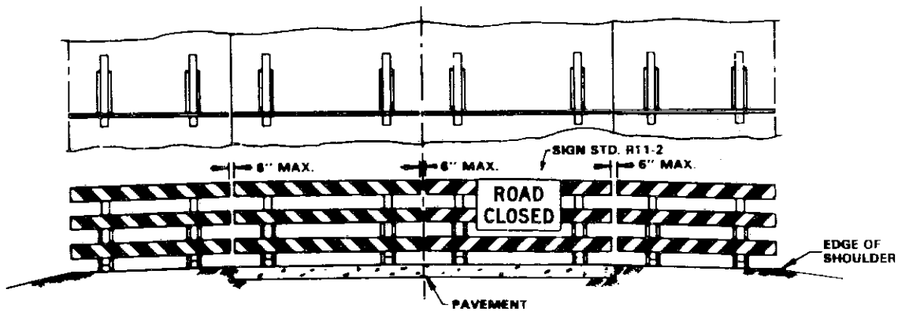
STANDARD 2230-16

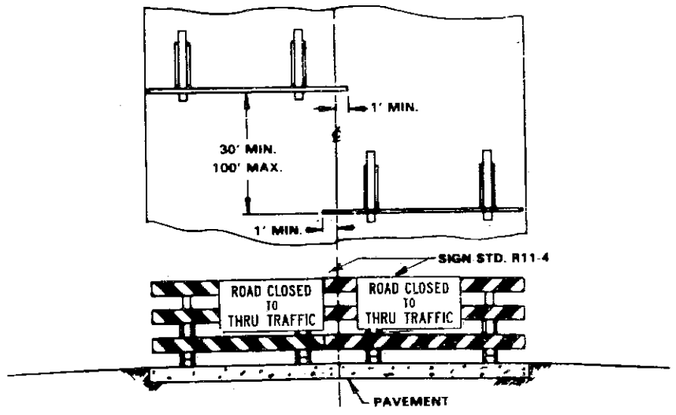
F-3.01n

TYPICAL APPLICATIONS OF TYPE III BARRICADES CLOSING A ROAD



ROAD CLOSED TO ALL TRAFFIC

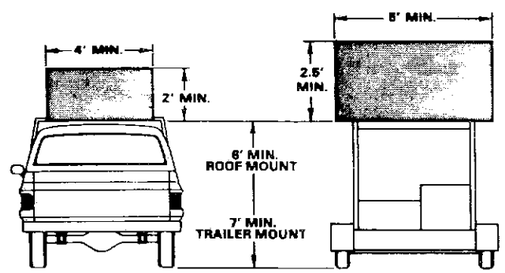
Reflectorized striping may be omitted on the back side of the barricades. The barricades shall be to the edge of the shoulders except when otherwise directed by the Engineer or shown on the detailed construction plans.



ROAD CLOSED TO ALL THRU TRAFFIC

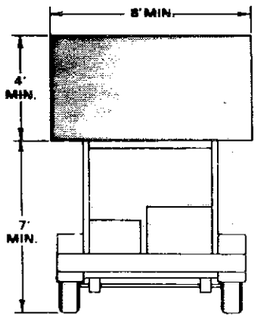
Reflectorized striping shall appear on both sides of barricades. The barricades shall be to the edge of the pavement, except when otherwise directed by the Engineer or shown on the detailed construction plans.

ARROW BOARDS



TYPE A
ROOF MOUNTED

TYPE B
ROOF OR TRAILER MOUNTED



TYPE C
TRAILER MOUNTED

Arrow boards shall conform to Article 718.22 of the Standard Specifications. On roads with speeds of 45 miles per hour and above, Type C units are to be used for all operations 24 hours or more in duration and Type B units may be used for operations less than 24 hours in duration. Type A, B or C units may be used for all operations on roads with speeds less than 45 miles per hour. Arrow boards shall not be used to direct passing moves into lanes used by opposing traffic.

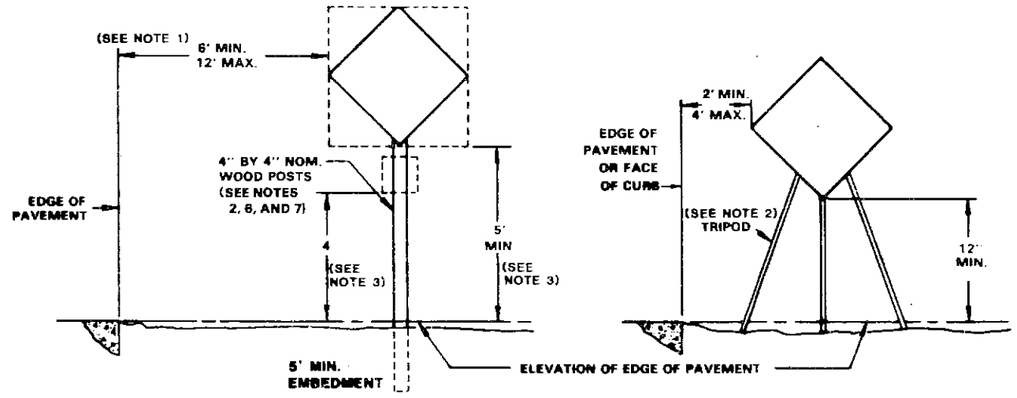
WORK LIMIT SIGNING

W7-3a(O)

G20-2(0)-6024

The NEXT X MILES supplemental plate shall be installed below the first warning sign in the series of all projects over two miles in length. The END CONSTRUCTION sign shall also be erected near the end of these projects, unless another project is within 2 miles beyond the end of the job.

TYPICAL SIGN INSTALLATIONS



1. 2 ft. minimum to face of curb.
2. Alternate designs and or materials may be permitted when authorized by the Engineer. All materials shall be substantial and durable.
3. Add 2 ft. if parking exists within 200 ft. in advance of the sign location or if pedestrian movement is likely to occur at any time during the project.
4. Signs on temporary supports shall be within 20° of a vertical position.
5. Weights of concrete, stone, or brick will not be allowed and all weights used to stabilize signs other than sandbags must be rigidly attached to the sign support as close to the ground as possible.
6. Two posts shall be used for signs greater than 16 sq. ft. in area or where the height between the sign and the ground exceeds 7 ft. Bracing no heavier than 2" x 4" wood may be used for added support. Any brace placed parallel to the road shall be sloped down toward approaching traffic.
7. If approved by the Engineer, skids may be used to support signs where posts are impractical. If used, they shall not exceed the structural design of Type III barricades and shall be no greater than 4 ft. in length.

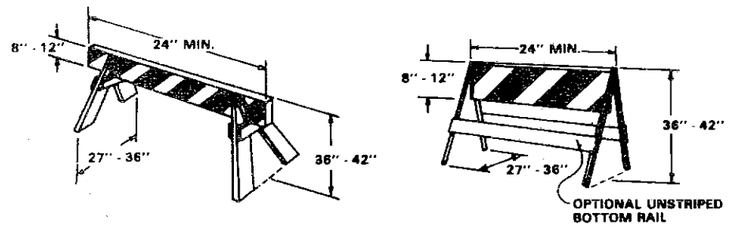
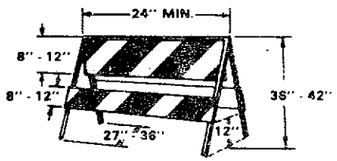
SHEET 1 OF 2

STANDARD 2298-9

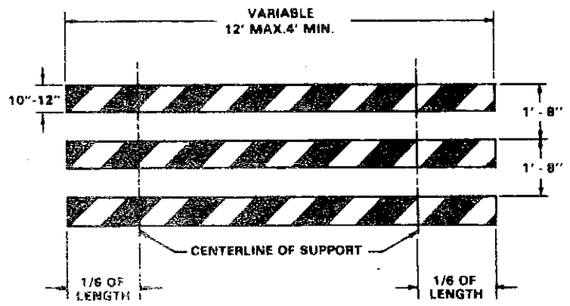
TYPE I BARRICADES

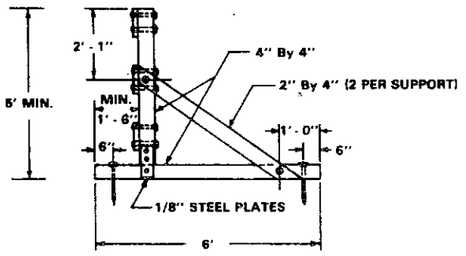


TYPE II BARRICADES

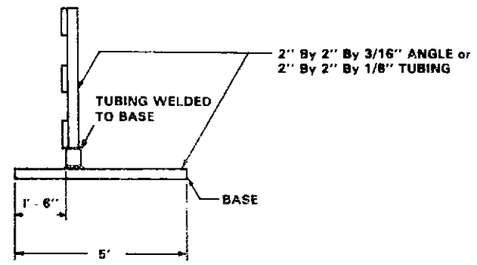


TYPE III BARRICADES



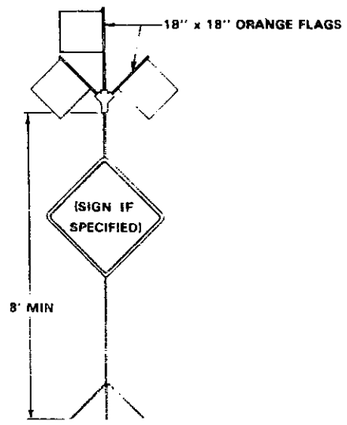


TYPICAL WOOD SUPPORT

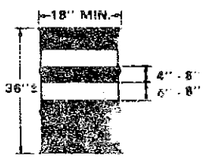


TYPICAL STEEL SUPPORT

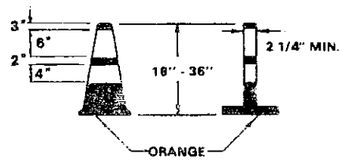
HIGH LEVEL WARNING DEVICE



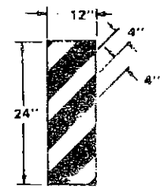
DRUMS



CONES



VERTICAL PANELS



SEE NOTE 14 FOR SUPPORT OR MOUNTING REQUIREMENTS

GENERAL NOTES

1. Type I Barricades are intended for use on lower speed roads and shall not be used where normal speeds are greater than 40 MPH unless the reflective area of the upper rail is at least 288 square inches.

2. Type I and Type II Barricades shall not be intermixed within an individual string of barricades.

3. Type III Barricades are intended for road and lane closures and shall not be used for channelization or delineation.

4. All heights shown shall be measured above the pavement surface.

5. Unless otherwise noted, the reflective sheeting used for barricades, drums, and vertical panels shall meet the requirements of Article 718.17 and 718.18 of the Standard Specifications for Road and Bridge Construction.

6. All barricades and vertical panels shall have alternating reflectorized white and reflectorized orange stripes sloping downward at 45° toward the side on which traffic will pass. Barricade stripes shall be 6 inches in width on barricades 36 inches or greater in length and 4 inches in width on barricades less than 36 inches in length. Type I and Type II Barricades shall be striped on both sides. Type III Barricades shall be striped on both sides where traffic approaches from either direction. Vertical panels placed on the outside of curves shall be striped on both sides. The predominant color for other barricade components shall be white or silver, except that painted galvanized metal or aluminum components may be used.

7. Drums shall be non-metallic and have alternating reflectorized orange and reflectorized white horizontal, circumferential stripes 4 inches to 8 inches in width. There shall be at least two orange and at least two white stripes on each drum. If nonreflective spaces are left between the orange and white stripes, they shall be no more than 2 inches in width. All nonreflectorized portions of the drums shall be orange or white. Drums may be slightly conical in shape and may have one or more flat surfaces to minimize rolling when hit.

8. Frames for Type I and Type II Barricades shall be designed so as to provide a stable support and should be constructed of light weight steel or aluminum angles or tubing, wood, plastic, or rubber and have no rigid stay bracing for "A" frame designs. As Type III Barricades are only used at closures, they may be constructed of heavier materials than Type I or Type II Barricades. However, they should not have any vertical or sloping supports heavier than 4-inch by 4-inch lumber, 2-inch by 2-inch by 1/8-inch steel tubing, or 2-inch by 2-inch by 3/16-inch steel angles.

9. Barricade rails shall be no heavier than 1-inch thick lumber or plywood except for the "sawhorse" design Type I Barricade which may have a rail no heavier than 2-inch thick lumber. Other light weight weather resistant materials such as plastic, fiberglass or sheet aluminum may be used. Barricade rails may be sloping or vertical. Nominal lumber dimensions may be used to satisfy wooden barricade component dimensions.

10. The name and phone number only of an agency, contractor, or supplier may be shown on the nonreflective surface of the face part of a barricade. Such identification shall be in one color and nonreflective with letters not to exceed 1-inch in height.

11. When used, warning lights on barricades, drums, or vertical panels shall be mounted above the top of the device to the side on which traffic will pass and shall not obscure any reflectorized portion of the device.

12. Weights of concrete, stone, or brick will not be allowed and all weights used to stabilize barricades other than sandbags must be rigidly attatched to the legs of the barricades as close to the ground as possible. No sandbags will be allowed on the top rail of barricades. Sandbags may be placed on barricade legs, over striped bottom rails not facing traffic, over unstriped bottom rails, or suspended from the barricade rail or frame in such a manner so that the bulk of the sand is at least 18 inches below the top of the barricade. Drums may be weighted internally with just enough sand, water, or other material to provide stability.

13. Cones shall be constructed of durable material able to withstand abuse by vehicular traffic. Minimum weights shall be 4 pounds for 18 inch, 7 pounds for 28 inch, and 10 pounds for 36 inch cones with a minimum of 60 percent of the total weight in the base. On fully access-controlled facilities, cones shall be a minimum of 28 inches in height. Reflectorized cones shall only be used as specified on the plans or as approved by the Engineer. When used, reflectorized cones shall be a minimum 28 inches in height and shall have two reflective bands: one a minimum of six inches wide placed three inches from the top of the cone and the other a minimum of four inches placed two inches below the six inch band.

14. Vertical panels may be either post mounted, frame supported or attached to the top of a barrier. Post mounted vertical panels shall be firmly attached to light weight wood or metal posts with the top a minimum height of 48 inches above the pavement surface. Frame supported vertical panels shall conform to General Notes 8, 9, 10 and 12 of this Standard and shall only be used where normal speeds are 40 MPH or less, with the top a minimum height of 36 inches above the pavement surface.

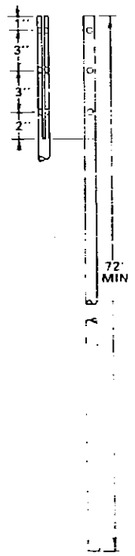
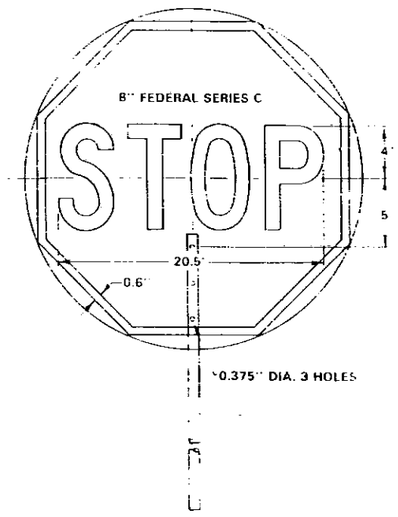
DESIGN OF TRAFFIC CONTROL DEVICES FOR HIGHWAY CONSTRUCTION AND CONTRACT MAINTENANCE

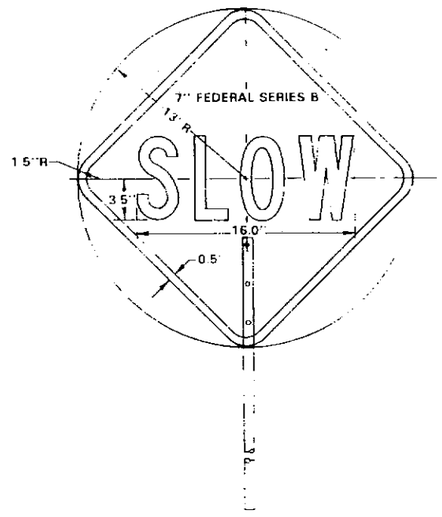
STANDARD 2299-13



STAFF



FRONT SIDE



REVERSE SIDE

GENERAL NOTES

1. The "STOP" face shall consist of white letters and border on a red reflectorized background.
2. The "SLOW" face shall consist of black letters and border on an orange reflectorized background.
3. Areas outside sign borders shall be light blue or black.
4. The sign blank may be octagonal in shape in lieu of circular.
5. The portion of the staff within the sign face shall match the sign colors.
6. All colors and letters shall meet applicable federal standards.
7. The staff shall consist of two sections joined by a coupling located 60 in. from the bottom of the staff. Alternate designs may be used when approved by the Engineer. All materials shall be substantial and durable.
8. This sign shall be furnished by the contractor and shall be used by the flagger in lieu of flags or other signaling devices. The cost of furnishing and maintaining the sign shall be considered incidental to the contract and no additional compensation will be allowed.

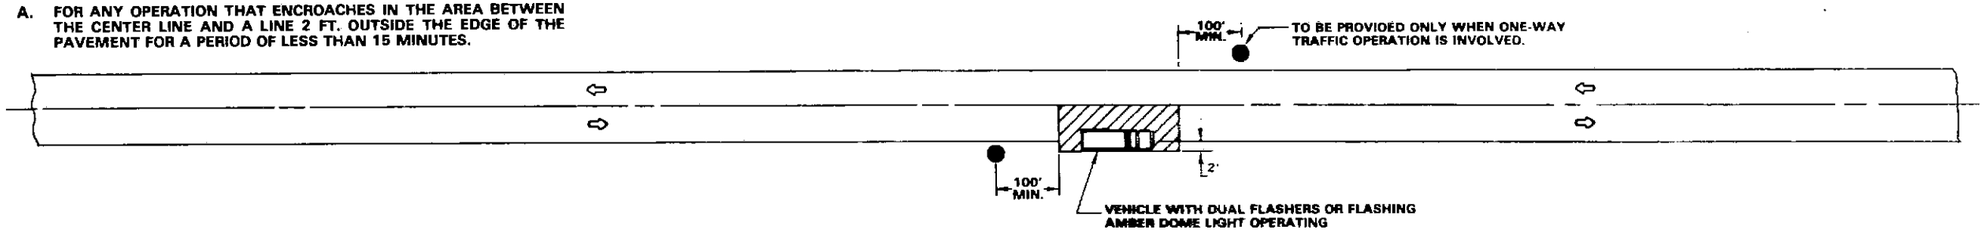
Issued 4-5-11

FLAGGER TRAFFIC CONTROL SIGN

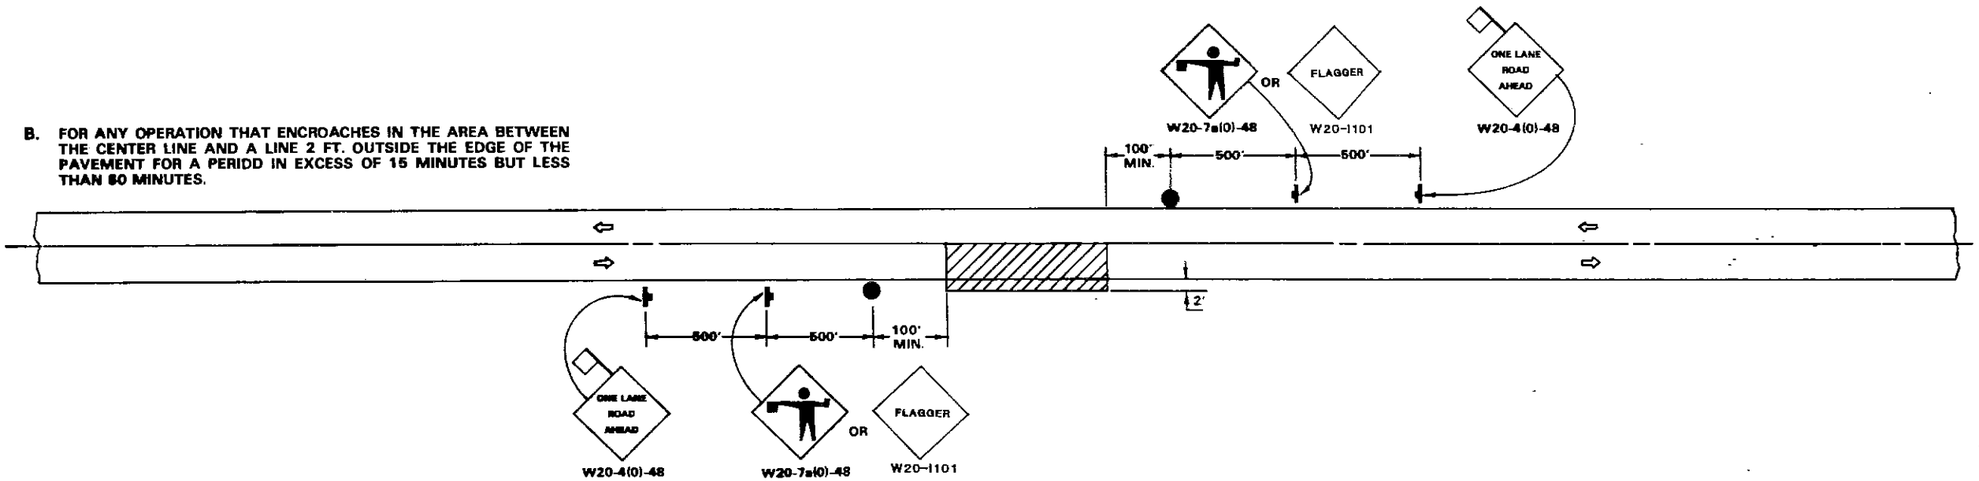
STANDARD 2300-3

F-6 030

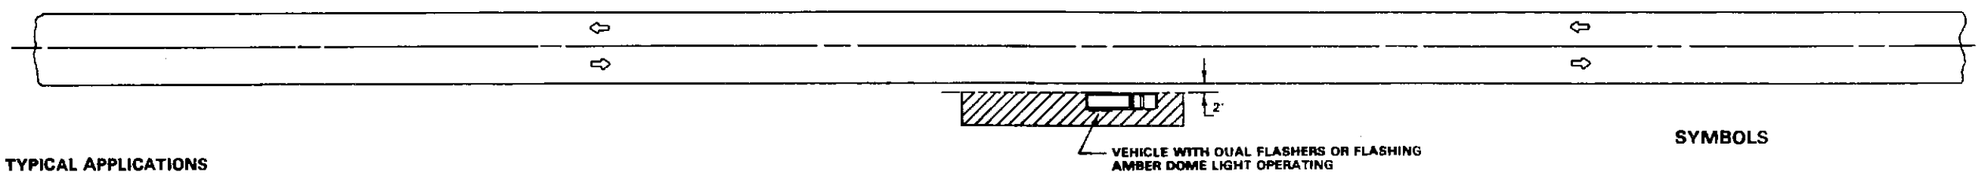
A. FOR ANY OPERATION THAT ENCROACHES IN THE AREA BETWEEN THE CENTER LINE AND A LINE 2 FT. OUTSIDE THE EDGE OF THE PAVEMENT FOR A PERIOD OF LESS THAN 15 MINUTES.



B. FOR ANY OPERATION THAT ENCROACHES IN THE AREA BETWEEN THE CENTER LINE AND A LINE 2 FT. OUTSIDE THE EDGE OF THE PAVEMENT FOR A PERIDD IN EXCESS OF 15 MINUTES BUT LESS THAN 60 MINUTES.



C. FOR ANY OPERATION THAT IS MORE THAN 2 FT. OUTSIDE THE EDGE OF THE PAVEMENT FOR A PERIOD OF LESS THAN 60 MINUTES.



TYPICAL APPLICATIONS

Marking Petches

Field Survey

String Line

Utility Operation

Cleaning Up Debris on Pavement

GENERAL NOTES

1. Construction operations shall be confined to one traffic lane. On two-lane roads, at least 500 ft. of both traffic lanes shall be available for traffic movement at intervals not greater than 1,000 ft. and a complete traffic control plan must be approved for any project expected to exceed 1,000 ft. in length.
2. The flaggers shall be in sight of each other or in direct communication at all times.
3. All signs are to be removed at completion of each operation.
4. For multilane roadways the flagger shown for traffic approaching from the opposite direction will be positioned as directed by the Engineer, the advance warning signs for traffic approaching from the opposite direction omitted, and the ONE LANE ROAD AHEAD sign changed to RIGHT (LEFT) LANE CLOSED AHEAD.
5. Longitudinal dimensions may be adjusted to fit field conditions. The lateral placement of the flaggers may be varied from that shown.

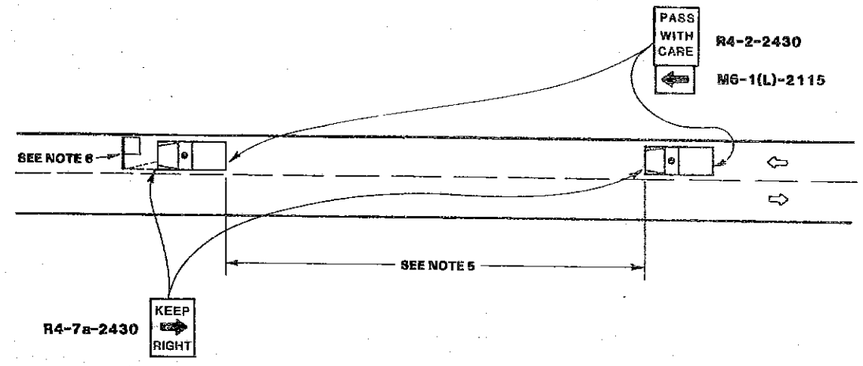
SEE NOTE 2

DETAIL B



GENERAL NOTES

1. For shoulder operations not encroaching on the pavement, use DETAIL A, Sheet 2.
2. During pavement marking operations, WET PAINT signs with appropriate arrow(s) shall be mounted on the back of the striper and following vehicle where necessary to reduce tracking.
3. In areas where the shoulder is inadequate for motorists to pass the convoy, the arrow boards shall be changed from the flashing arrow mode to a flashing hazard mode. In no case shall the arrow boards be visible to traffic approaching the front of the convoy in the open lane. Arrow boards shall never flash to indicate passing on the left on a two-lane, two-way roadway.
4. All vehicles shall have headlights and emergency flashers operating and shall display an amber colored oscillating, rotating or flashing light(s). At least one amber light is to be visible from any direction.
5. Trailing vehicles shall be at least 200 feet behind the lead vehicles with the distance varying depending upon the terrain and susceptibility of any pavement marking to wheel tracking.
6. If a guide wheel is used in pavement marking operations, it shall be equipped with a flag as shown.

GENERAL NOTES

1. If the work operation does not exceed 60 minutes, traffic control may be in conformance with STANDARD 2307.
2. Worker signs are to be removed when no work is being performed. Any unattended obstacle or excavation in the work area which in the opinion of the Engineer constitutes a hazard shall be protected by barricades at 50 ft. centers, with flashing lights at night. If the hazard exceeds 100 ft. in length, steady burning lights shall be substituted for flashing lights. When the distance is greater than 250 ft., barricade spacing may be increased to 100 ft.
3. If the work operation requires that four or more work vehicles enter through traffic lanes in a one hour period, a flagger shall be provided and a Flagger sign shall be substituted for the Worker sign.
4. Signs mounted in the median may be omitted when the median is less than 10 feet wide.
5. This standard also applies when work is being performed on a multilane undivided highway. Under these conditions the signs normally mounted in the median shall be omitted.
6. Longitudinal dimensions may be adjusted to fit field conditions.

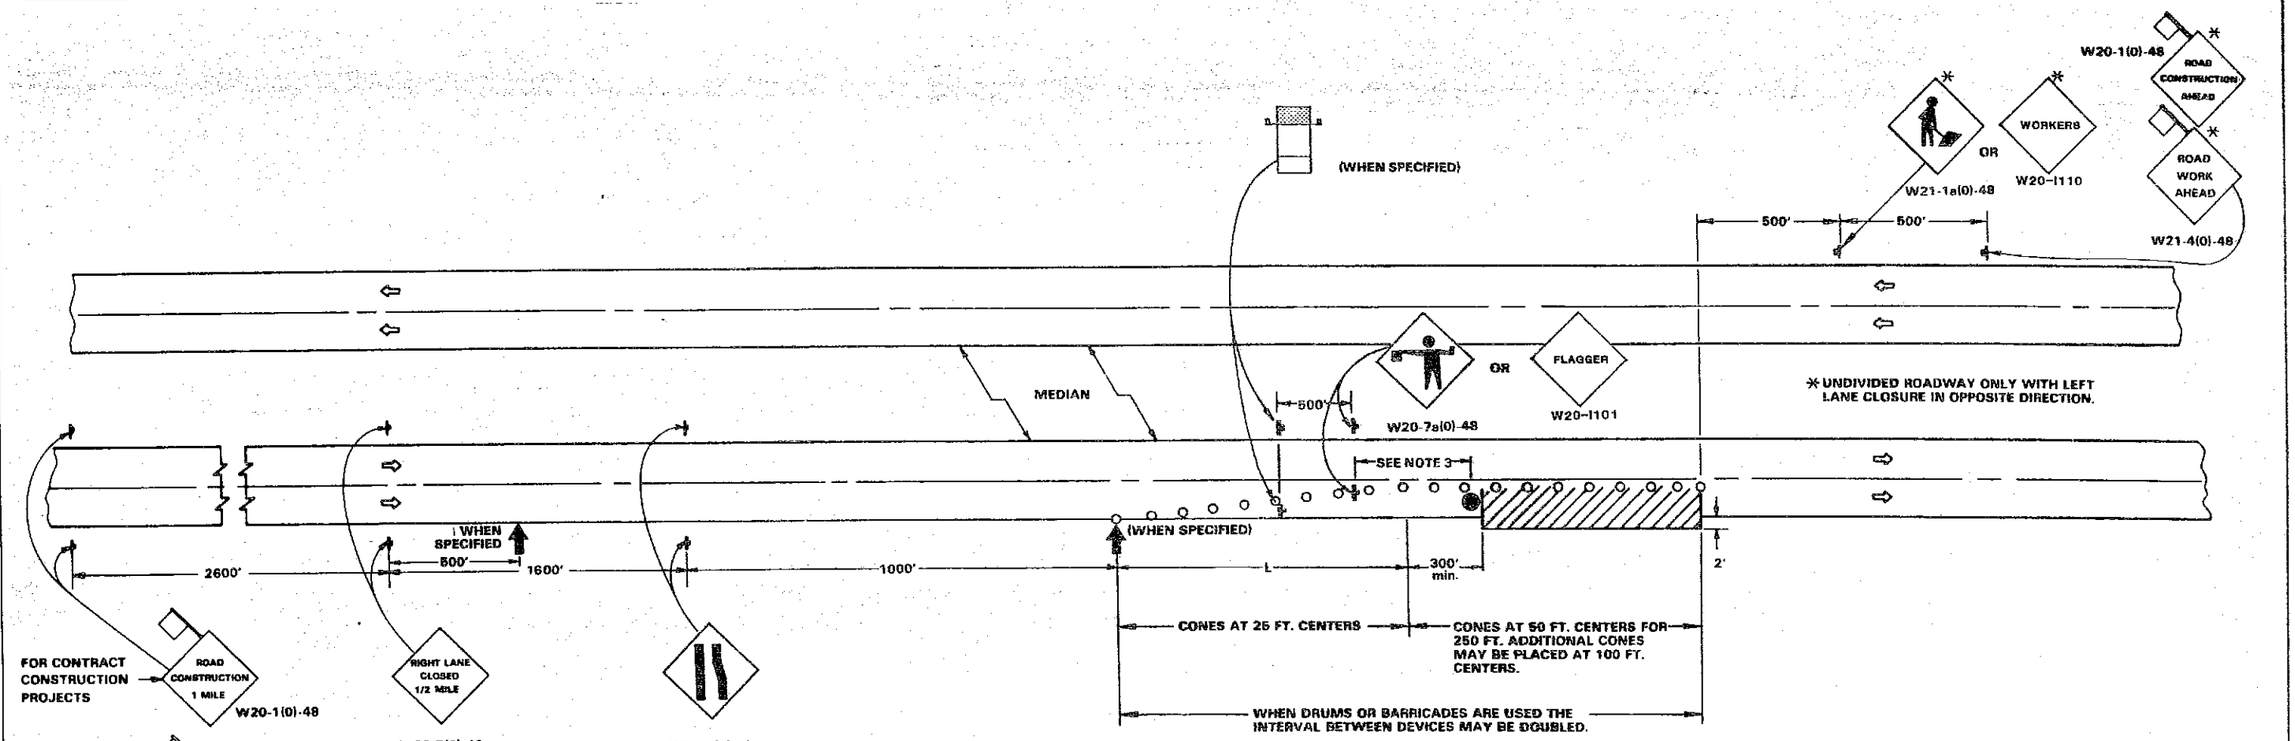
STANDARD 2314-6



TYPICAL APPLICATIONS

Pavement Patch

Utility Operations

Bituminous Resurfacing

GENERAL NOTES

1. The "L" distance equals the lane width times the taper ratio.

Normal Posted Speed m.p.h.	Taper Ratio ft./ft.
65	65/1
60	60/1
55	55/1
50	50/1
45 or less	45/1

2. When no work is being performed, the flagger will not be required. If the flagger is not present, the Flagger and Worker signs shall be removed or covered.
3. The Construction Speed Limit signs (when specified) and the Flagger signs shall be moved as necessary to maintain a spacing of 500 feet to 1.5 miles between the Flagger and Flagger signs.
4. This standard also applies when work is being performed in the left lane. Under these conditions, LEFT LANE CLOSED signs shall be substituted for RIGHT LANE CLOSED signs. On undivided highways, signs shall be added in the opposite direction as shown and cones shall be placed along the center line throughout the taper and work area. On left lane closures with narrow medians, the arrow board at the beginning of the lane closure (when specified) shall be relocated behind the taper as necessary so that a clearance of at least 4 ft. can be maintained from the opposing traffic.
5. The speed limit to be shown on the Construction Speed Limit signs and Advisory Speed plates shall be 10 miles per hour less than the normal posted speed limit or 45 MPH, whichever is less. The signs shall not be used where the normal posted speed limit is below 45 miles per hour.
6. The flashing lights on the Construction Speed Limit signs shall be activated only when workers are present in a lane adjacent to one open to traffic. At all other times, the flashing lights shall be turned off and the signs may be removed.
7. All signs, cones, barricades and drums are to be removed at completion of the day's operations and the work area opened to traffic.
8. Median signs may be omitted when the median is less than 10 feet wide.
9. This standard does not apply when work is being performed in the middle lane(s) of a six or more lane highway. Special plans approved by the Engineer will be required.
10. On fully access-controlled facilities, cones shall be a minimum of 28 in. in height.
11. Longitudinal dimensions may be adjusted to fit field conditions. The lateral placement of the flagger may be varied from that shown. The flagger shown at the beginning of the work area shall be stationed approximately 200 feet in advance of the work party.
12. At all times when workers are present, a flagger shall be positioned in advance of the first work operation as shown. (See Note 2) An additional flagger, as required by Paragraph 10 of Article 107.14 of the Standard Specifications, shall be positioned in advance of each separate activity of the operation that requires frequent encroachment into a lane open to traffic.
13. Form BT 725 may be required.

SYMBOLS

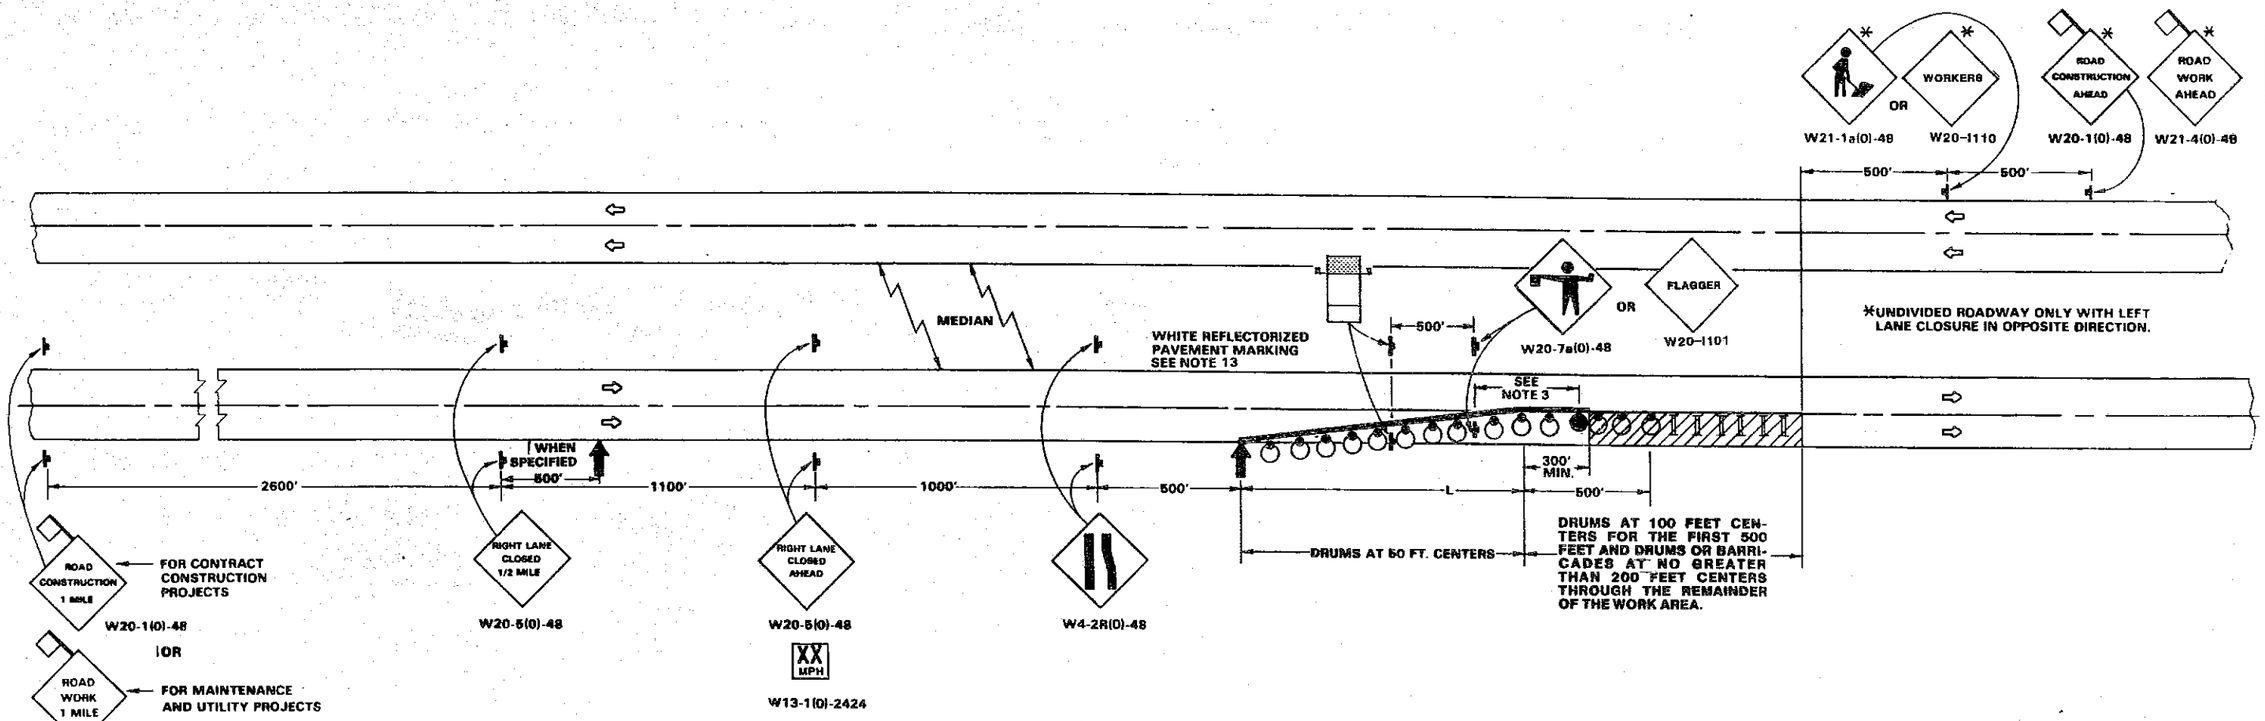
MULTILANE, DIVIDED AND UNDIVIDED, RURAL DAY OPERATIONS ONLY

Where, at any time, any vehicle, equipment, workers or their activities will encroach on any portion of the lane immediately adjacent to the shoulder or on the shoulder within 2 ft. of the edge of pavement.

STANDARD 2315-8



GENERAL NOTES

1. The "L" distance equals the lane width times the taper ratio.

Normal Posted Speed m.p.h.	Taper Ratio ft./ft.
65	65/1
60	60/1
55	55/1
50	50/1
45 or less	45/1

2. When no work is being performed, the flagger will not be required. If the flagger is not present, the Flagger and Worker signs shall be removed or covered.
3. The Construction Speed Limit sign and the Flagger sign shall be moved as necessary to maintain a spacing of 500 feet to 1.5 miles between the flagger and the Flagger sign.
4. This standard also applies when work is being performed in the left lane. Under these conditions, LEFT LANE CLOSED signs shall be substituted for RIGHT LANE CLOSED signs. On undivided highways, signs shall be added in the opposite direction as shown. On left lane closures with narrow medians, the arrow board at the beginning of the lane closure shall be relocated behind the taper as necessary so that a clearance of at least 4 ft. can be maintained from the opposing traffic.
5. The speed limit to be shown on the Construction Speed Limit signs and Advisory Speed plates shall be 10 miles per hour less than the normal posted speed limit or 45 MPH, whichever is less. The signs shall not be used where the normal posted speed limit is below 45 miles per hour.
6. The flashing lights on the Construction Speed Limit signs shall be activated only when workers are present in a lane adjacent to one open to traffic. At all other times, the flashing lights shall be turned off and the signs may be removed.
7. Median signs may be omitted when the median is less than 10 feet wide.
8. This standard does not apply when work is being performed in the middle lane(s) of a six or more lane highway. Special plans approved by the Engineer will be required.
9. Cones may be substituted for barricades or drums at half the spacing during day operations. On fully access-controlled facilities, cones shall be a minimum of 28 in. in height.
10. Steady burning lights will not be required on drums for day operations. All drum lights shall be monodirectional.
11. All signs shall be post-mounted if the closure time exceeds four days.
12. Flashing lights shall be used on each approach in advance of the work area during hours of darkness and installed above the first two signs in each series.
13. Reflectorized temporary pavement marking tape shall be placed throughout the taper and for 300 feet along-side the work area where the closure time is greater than fourteen days. The edge line shall be yellow for left lane closures. Raised reflectorized pavement markers at 25 ft. centers may be used to supplement the pavement marking tape.
14. Longitudinal dimensions may be adjusted to fit field conditions. The lateral placement of the flagger may be varied from that shown. The flagger shown at the beginning of the work area shall be stationed approximately 200 feet in advance of the work party.
15. At all times when workers are present, a flagger shall be positioned in advance of the first work operation as shown. (See Note 2) An additional flagger, as required by Paragraph 10 of Article 107.14 of the Standard Specifications, shall be positioned in advance of each separate activity of the operation that requires frequent encroachment into a lane open to traffic.
16. Form BT 725 is required.

BOX OUTLET

WHEN PRECAST

INLET TYPE	SHOULDER WIDTH
Type B	Less than 1.52 m (5')
Type C	1.52 m (5') 1.83 m (6')
Type D	Greater than 1.83 m (6')

GENERAL NOTES

All exposed edges of the inlet, except the upper perimeter, shall be beveled 19 mm (¾).

For placement of approach shoulder pavement on existing construction substitute expansion anchor ties for tie bars. Omit tie bars for flexible approaches or Bridge Approach Shoulder Pavement constructed monolithically with shoulder pavement.

NOTES

For details of guardrail not shown see Standard 2230.

The Standard End Shoe shall be attached to the existing concrete with Pre-drilled or Self-drilling anchor bolts. The anchor cone shall be set flush with the surface of the concrete. Externally threaded studs protruding from the surface of the concrete will not be permitted.

The Standard End Shoe shall be placed between the splice plate and the rail element.

The minimum edge distance (distance from any anchor to edge of existing concrete) shall be six (6) inches unless otherwise shown.

If the existing name plate is covered completely or partially by the end shoe, the name plate shall be moved to an adjacent area along the rail or end post. The cost of moving the name plate shall be included in the cost of TRAFFIC BARRIER TERMINAL, TYPE 10.

Pay limits of guardrail shall be at ℄ of end shoe splice.

The cost of the Standard End Shoes, Splice Plate, any required blocks and plates, and all fasteners shall be included in the cost of TRAFFIC BARRIER TERMINAL, TYPE 10 (One Each).

When a bridge expansion joint exists between the End Shoe and the first post, all splice bolts at the End Shoe shall be fitted with a locknut or double nuts tightened only to a point that will allow guardrail movement.

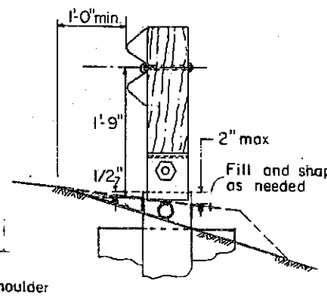
PLAN TYPE 1A



SECTION A-A

NOTE

If the surface upon which the barrier is to be set is 10:1 or flatter, the Type 1A Terminal should be flared as much as possible, but should not exceed the offsets provided for the Type 1 Terminal.

GENERAL NOTES

See Standard 2230 for details of guard rail not shown.

All steel parts shall be galvanized after fabrication.

Posts at locations 1 & 2 shall be wood breakaway posts. Posts other than 1 & 2 may be either standard wood posts or steel posts, at the option of the Contractor. If standard wood posts are used, one post shall be located midway between and in lieu of posts 4 & 5. For Terminal Type 1, the offset (Y) for this post shall be 1.00 foot.

The wood breakaway posts shall be treated and conform to the requirements of Art. 711.06 of the Standard Specifications.

A two-piece assembly may be substituted for the one-piece nose shown above

Hollow structural tubing shall conform to the requirements of ASTM A-500 grade B or A-501.

The Bearing Plate "K" shall be held in position by (2) two eightpenny nails driven into the post and bent over the top of the plate

GENERAL NOTES

For details of Guardrail not shown, see Standard 2230.

When pavement is on a curved alignment, guardrail shall be approximately curved to match the alignment.

For dual structures that are 90°, or skewed left forward, the length of guardrail shown is appropriate.

* For dual structures skewed right forward the nose of the Type 4 Terminal shall be positioned longitudinally away from the structures for a distance equal to dimension Z. Appropriate adjustments to the length of the Type A Guardrail and its offsets (Y) shall be calculated and used. All additional lengths of guardrail shall be in increments of 12'-6".

All steel parts shall be galvanized after fabrication.

The wood posts shall be treated and conform to the requirements of Article 711.06 of the Standard Specifications.

SECTION A-A

SECTION B-B

GENERAL NOTES

See Standard 2230 for details of guardrail not shown.

Rubrail Sections and the Bearing Plate shall conform to the requirements of AASHTO M-183. They shall be galvanized after fabrication in accordance with AASHTO M-111.

The Rubrail shall be fastened to the parapet/support by three 16x152 mm (5/8"x6") long hex bolts with 16 mm (5/8") expansion anchors or other approved cast-in-place insert devices.

The End Shoe shall be fastened to the parapet/support by four 22x152 mm (7/8"x6") long hex bolts conforming to AASHTO M164M or M164 with approved 22 mm (7/8") cast-in-place insert devices. An alternate method which uses thru-drilled holes with 16 mm (5/8") bearing plate may also be used.

Steel Spacer Tube shall be galvanized in accordance with Article 710.33(b)(1) of the Standard Specifications.

The Wood Block-Out shall be treated in accordance with Article 711.12 of the Standard Specifications.

All dimensions are in millimeters (inches) unless otherwise noted.

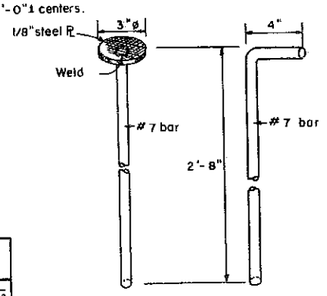
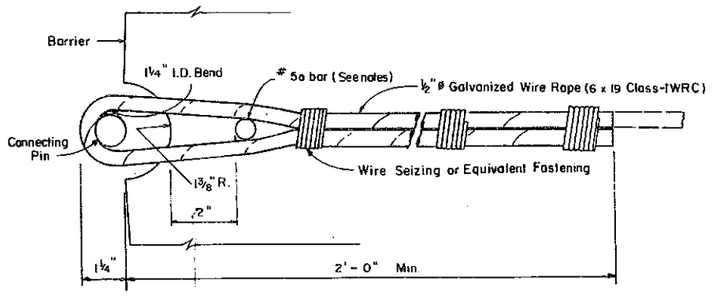
TYPICAL INSTALLATION WITH STYROFOAM PADS



ALTERNATE CONNECTING PINS



WIRE ROPE LOOP DETAIL
(20,000 lbs. min. breaking strength)

Not to scale

Design Notes will not appear in the contract plans.

GENERAL NOTES

Barrier units shall be pinned one to another in continuous smooth line at the exact locations provided by the Engineer.

The wall units shall be reinforced with either bar reinforcement or welded wire fabric. Welded Wire Fabric shall be 6x6-W4x W4, weighing approximately 58lbs. per 100 sq.ft., conforming to the requirements of AASHTO M-55.

Barrier units placed on rigid pavement or median surfaces shall be seated with styrofoam pads. Units placed on flexible pavement or shoulders shall be secured with dowel bars. Dowel bars shall be one inch in diameter, at least 12 inches long, shall be embedded at least 6 inches into base material, and shall not project above the outer surface of the barrier. After pin removal all holes in the base shall be grout filled.

Alternate lifting devices meeting the approval of the Engineer may be substituted for the lifting slots shown.

When the Terminal Section is used, the hex nut on the drift pin shall be threaded half way onto the pin and tack welded, or a coupling nut tightened sufficiently to prevent loosening may be used. Fill nut with grease to exclude contaminants.

Inserts for ½" ø bolts shall be capable of 3000 lbs. pull out strength and shall be furnished with a galvanized bolt and washer.

The #5 bar may be omitted if 2 continuous wire ropes are substituted for the 4 wire rope loops shown. The continuous ropes shall be looped and fastened on each end as shown in the wire rope loop detail.

The Contractor shall have the option to furnish Barrier with or without the longitudinal keyway unless otherwise specified.

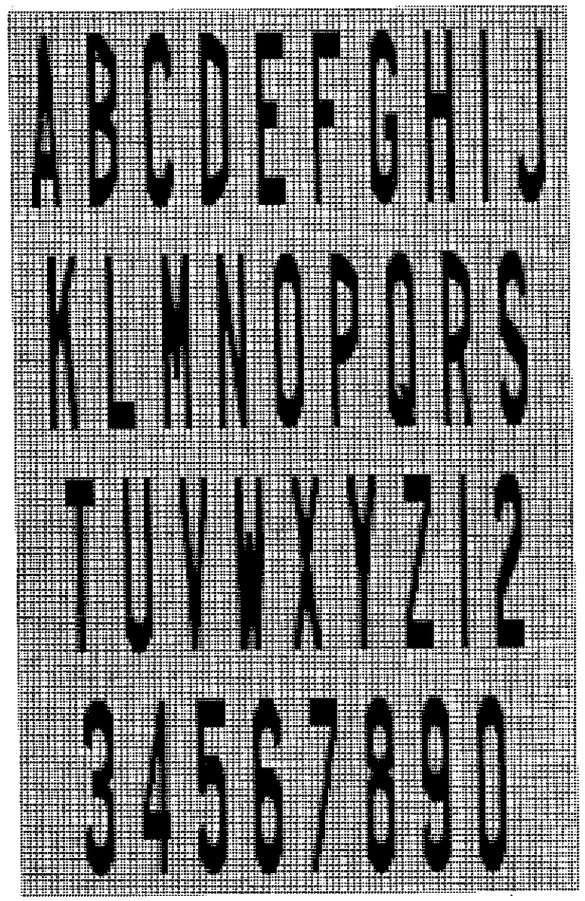
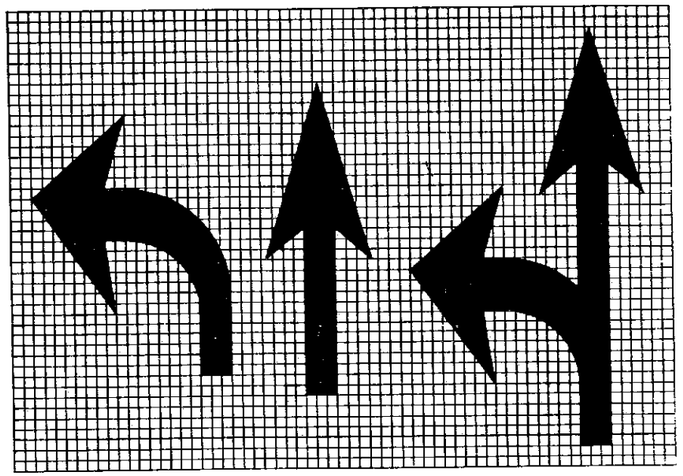
TEMPORARY CONCRETE BARRIER

STANDARD 2383-3

(Full Size) D.W.W. Sr.

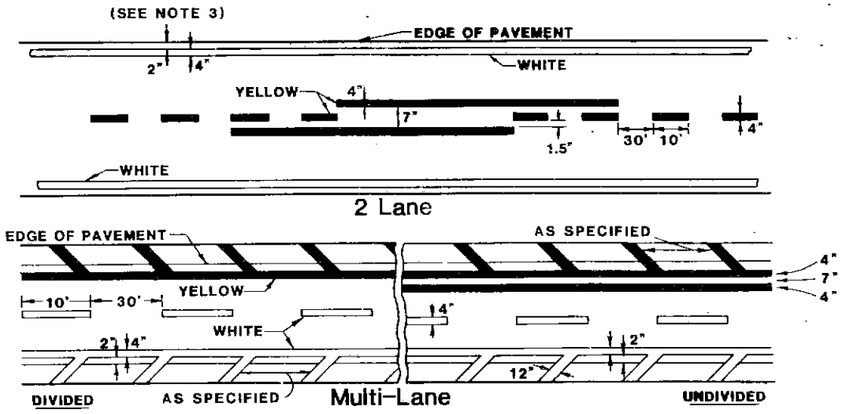




Legend Height	Arrow Size	a
6'	Small	2.9"
8'	Large	3.8"

The space between adjacent letters or numerials should be approximately 3 inches for 6 foot legend and 4 inches for 8 foot legend.

LETTER AND ARROW GRID SCALE

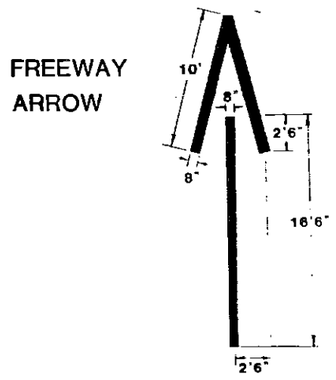


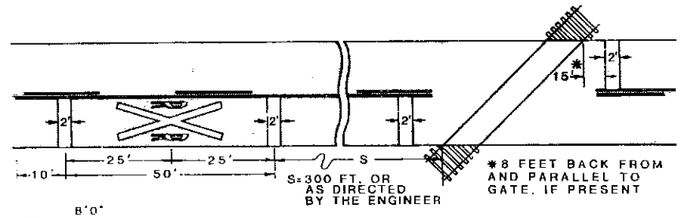
TYPICAL LANE AND EDGE LINES

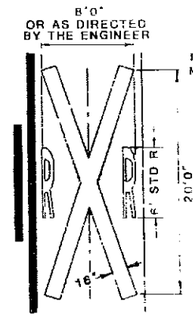
NOTES:

1. Diagonals shall be used only where specified in the plans.
2. Unless directed by the Engineer, lines shall not be laid directly over a longitudinal crack or joint nor over a tar or asphalt painted line. The edge of a center line or lane line shall be offset a minimum of two inches from a longitudinal crack or joint.
3. Edge lines shall be placed on the shoulder, 2 inches from the edge of pavement when specified in the plans.

TYPICAL WORD AND ARROW LAYOUT







THE TRANVERSE SPREAD OF THE 'X' MAY VARY ACCORDING TO LANE WIDTH.

On multi-lane roads, the stop lines shall extend across the right-hand lanes only to the center line and separate RXR symbols shall be placed adjacent to each other in each lane.

STANDARD PAVEMENT MARKINGS AT RAILROAD-HIGHWAY GRADE CROSSING

Illinois Department of Transportation

Approved 4-3-85

R. W. Jones

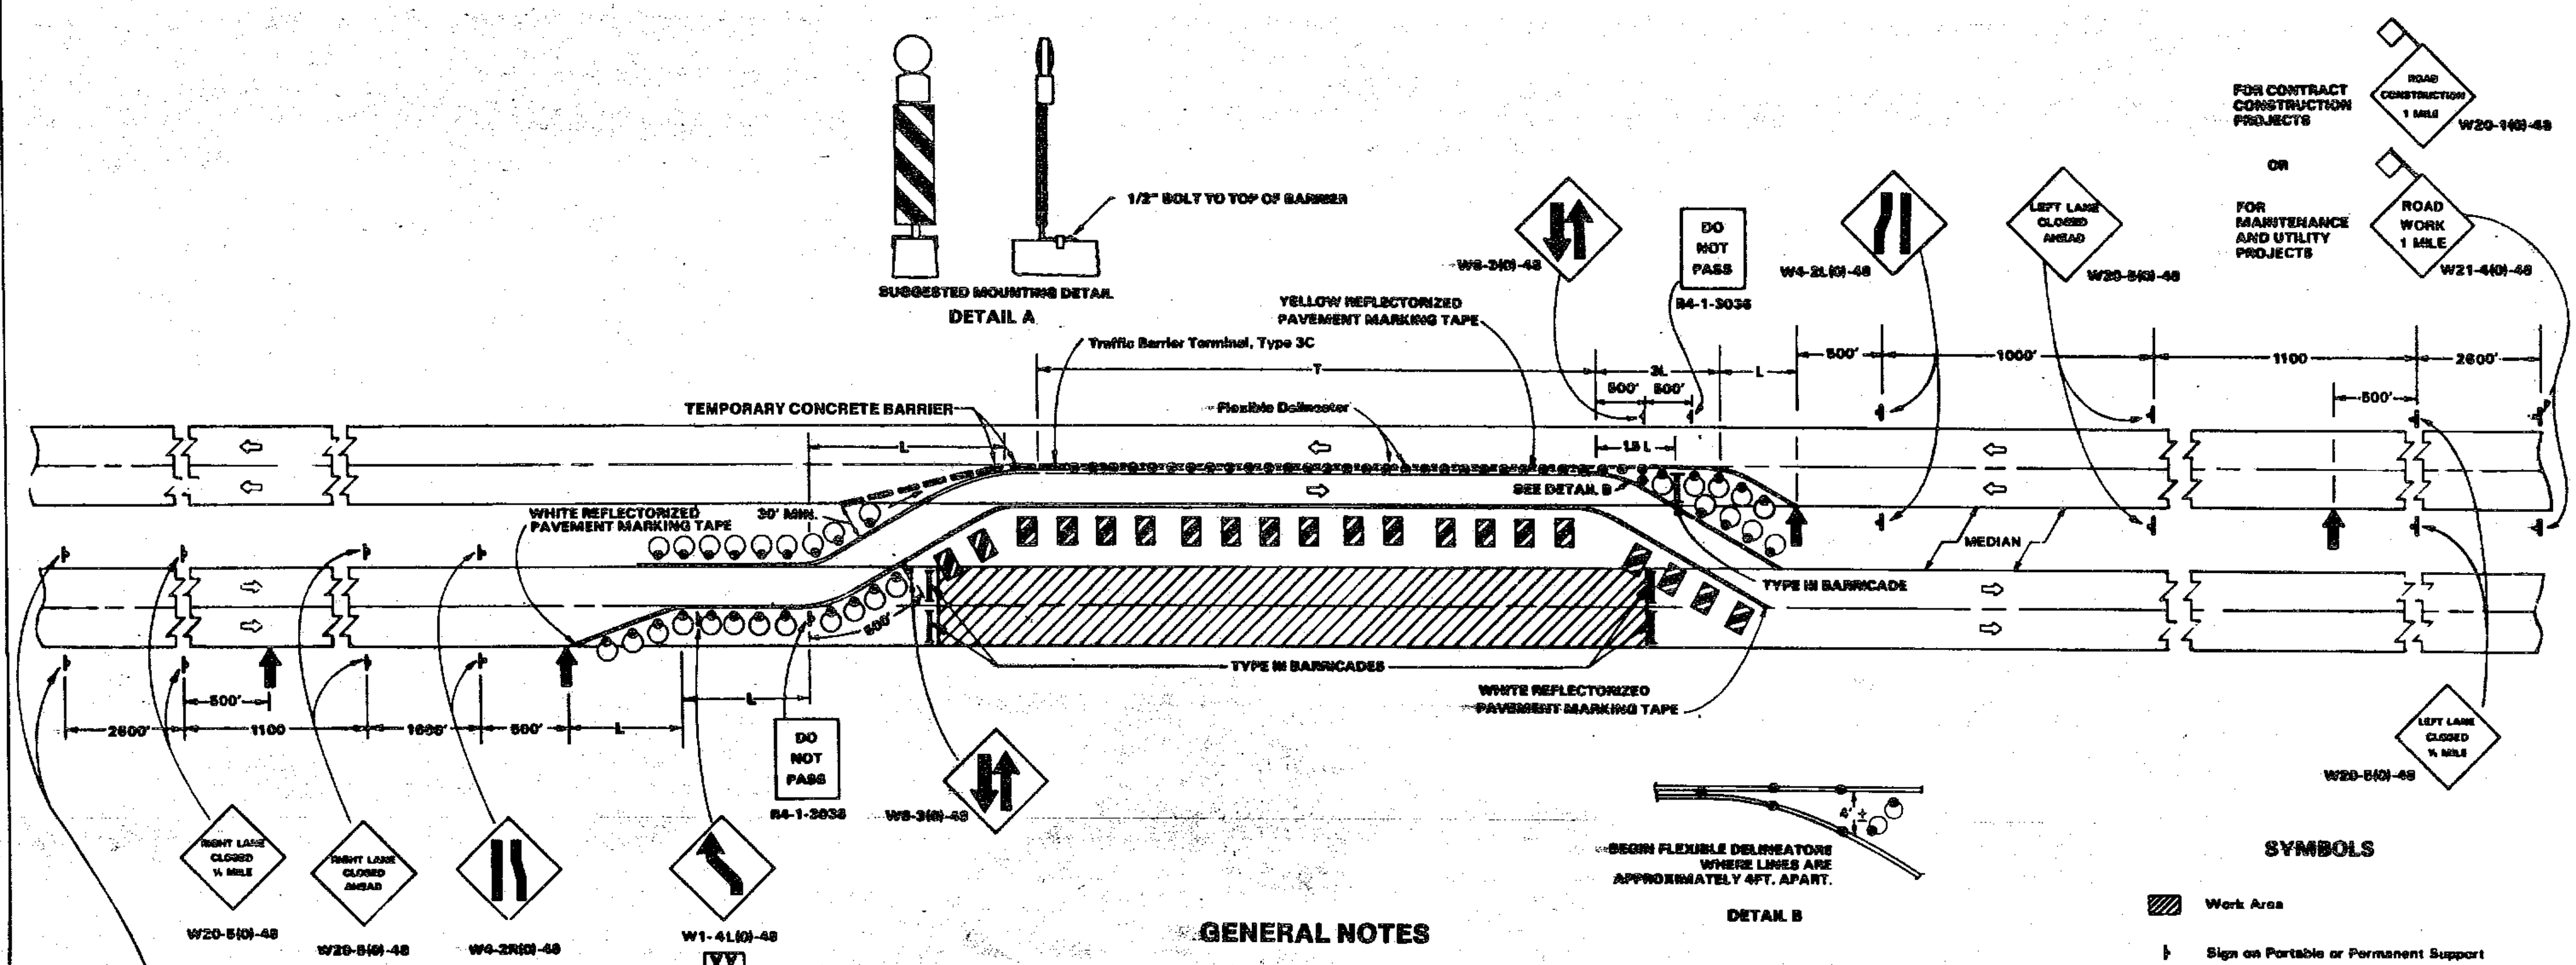
Engineer of Traffic

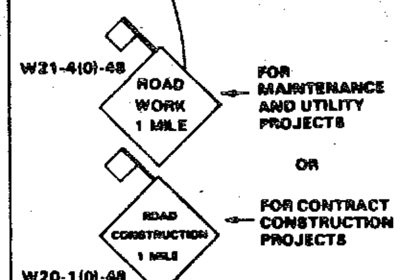
Issued 4-3-85

TYPICAL PAVEMENT MARKINGS

STANDARD 2396

F-6.04





SYMBOLS

- Work Area
- Sign on Portable or Permanent Support
- Barricade
- Drum with Steady Burning Light
- Vertical Panel
- Arrow Board
- 18 in. X 18 in. (minimum) Orange Flag
- Flexible Delineator
- Temporary Concrete Barrier

GENERAL NOTES

1. Reflective, solid edge lines and a double yellow centerline shall be used when the closure time exceeds four days or when the normal posted speed outside the area of operations exceeds 50 miles per hour. Reflectorized pavement marking tape shall be used for marking the edge lines and center line on existing pavement. Either tape or reflectorized pavement marking paint may be used for markings on the paved crossovers. Raised reflective pavement markers at 25 ft. centers shall also be installed to provide additional delineation. All existing pavement markings which conflict with the revised traffic pattern shall be removed.

2. Two-Way Traffic sign(s) shall be repeated every one-quarter mile in each direction through the tangent distance.

3. All drums and vertical panels shall be at 50 ft. centers. Where the tangent distance "T" on the temporary runaround exceeds 600 ft., clear delineators at 50 ft. centers may be substituted for the vertical panels, or spacing between vertical panels may be increased to 100 ft. within the limits of the tangent.

4. Cones may be substituted for drums or flexible delineators at half the spacing during day operations. On fully access-controlled facilities, cones shall be a minimum of 28 in. in height.

5. Reflectorized flexible delineators are to be attached to the pavement at 50 ft. centers for the first 250 feet at each end of "T", and at 100 ft. centers throughout the remainder of "T".

6. The impact attenuator shall be positioned so as not to encroach onto the outer lane. Vertical panels (See detail A) shall be attached to the concrete barriers where available space prohibits use of drums.

7. The speed limit to be shown on the advisory speed plate shall be 10 miles per hour below the normal posted speed limit or 45 MPH, whichever is less. The signs shall not be used where the normal posted speed limit is less than 45 miles per hour.

8. A curve sign will be required 500 ft. in advance of the exit end of the runarounds if "T" is equal to or greater than 1,000 feet.

9. The "L" distance equals the lane width times the taper ratio.

Normal Posted Speed m.p.h.	Taper Ratio ft./ft.
65	65/1
55	55/1
50	50/1
45 or less	45/1

10. Signs mounted in the median may be omitted when the median is less than 10 feet wide. Arrow boards mounted in the median may be omitted when the median is less than 20 feet wide.

11. Steady burning lights will not be required on drums for day operations. All drum lights shall be monodirectional.

12. All signs shall be post mounted if the closure time exceeds four days.

13. Flashing lights shall be used on each approach in advance of the work area during hours of darkness and installed above the first two signs in each series.

14. Longitudinal dimensions may be adjusted to fit field conditions.

15. Form BT 725 is required.

Illinois Department of Transportation

Approved 21 March 1989

R. W. Jones
Engineer of Traffic

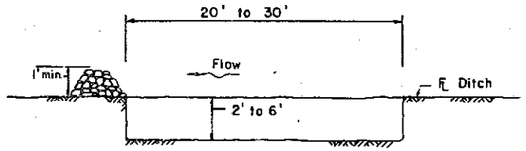
TYPICAL APPLICATION OF TRAFFIC CONTROL DEVICES HIGHWAY CONSTRUCTION AND CONTRACT MAINTENANCE

MULTILANE, DIVIDED. RURAL DAY OR NIGHT OPERATIONS

Where at any time, any vehicle, equipment, workers or their activities require the closure of two adjacent lanes and a temporary crossover is provided by making use of one lane of pavement normally used by the opposing flow of traffic and positive barrier is used in the transition to separate the opposing traffic.

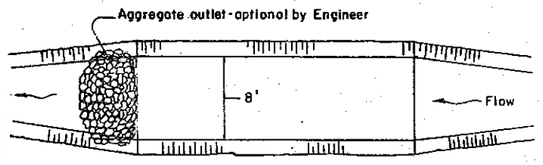
STANDARD 2417-2

SEDIMENT BASIN



SECTION THRU ELEVATION

The performance of the basin will improve if put into a series.



PLAN VIEW

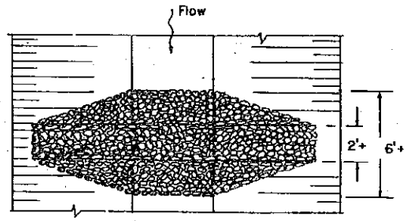
APPROVED Mar. 6, 1979
Engineer of Design

ISSUED 3-6-79

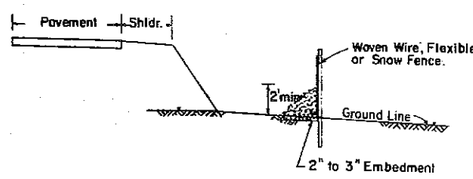
AGGREGATE DITCH CHECK



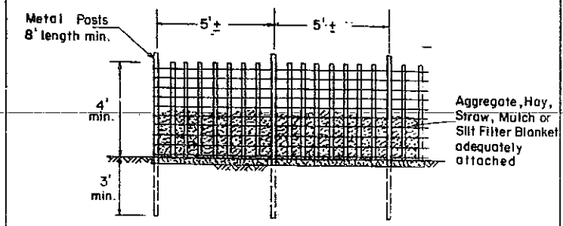
To be constructed by depositing material and shaping in a manner approved by the Engineer.

If the ditch check is within the clear zone and the road is open to traffic, the traffic approach slope of the aggregate shall be graded to 4:1.

MULCH BARRIER



SIDE ELEVATION VIEW



FRONT ELEVATION VIEW

GENERAL NOTES

Actual configuration and location of Temporary Erosion Control Systems shall be as shown on the plans or as directed by the Engineer.

Ditch Checks and Sediment Basins should be constructed at appropriate intervals along the waterway to be effective.

Where more than one row of bales are used, stagger bales to cover joints.

Where bales are shown staked, a minimum of two stakes per bale shall be used.

The Temporary Erosion Control Systems installed by the Contractor shall be properly maintained as directed by the Engineer to control siltation at all times during the life of the contract.

All salvageable temporary erosion control items shall be removed and become the property of the Contractor at the completion of the contract.

Existing R.O.W. fence may be utilized if such location is desired with use of Mulch Barrier or Hay or Straw Ditch Check - Two Bales High.
