TABLE OF CONTENTS

LIST OF APPENDICES

I. GENERAL INFORMATION

A. Project Location and Description

The improvement of I-57 begins at station 124+00 north of Grinnell Road and continues south approximately 0.758 miles where it ends at station 164+00 and is located within sections 27, 28, 33, and 34 of T31N, R12E, 3rd Principal Meridian, Kankakee County, Illinois.

The improvements through this section include the following:

- Raising the profile and reconstruction of I-57 from 124+00 to 164+00
- Construction of SN 046-0158 and 046-0159, which will carry Interstate 57 over Grinnell Road.
- Construction of SN 046-0156 and 046-0157, which will carry Interstate 57 over the Norfolk Southern Railway and a drainage ditch.

SGRs have been prepared for these structures and are available upon request. A project location map is provided in Appendix A.

B. Proposed Pavement Design

The northbound and southbound sections of I-57 will each consist of two 12' driving lanes with 12' concrete shoulders, and will be constructed of 11 inches of continuously reinforced PCC pavement, 4 inches of stabilized sub-base (hot-mix asphalt), and 12 inches of subbase granular material, type A.

Existing and Proposed typical sections are included in Appendix B.

C. Soils

The soils in the project area are primarily silty loam and clayey loam, which can be found in the Web Soil Survey in Appendix C. The project location consists mostly of embankment material that was used in constructing the existing four lane highway, therefore it is unlikely that there will be issues placing new embankment for the proposed improvements. Of the existing embankment material, there is a variety of different soil classifications that were found and can be seen on the IDH Textural Classification Charts in Appendix D. Most of these soils have unconfined compressive strengths greater or equal than 1.5 tons per square foot when measured with a pocket penetrometer.

D. Geology

The project lies within the Kankakee Plain, of the Till Plains Section of the Central Lowland Province of Illinois. The quaternary deposits within the limits of the project are in the till plain from intermorainal areas of the Wisconsin Episode. The bedrock in this area is limestone and the elevation varies between 625 and 632, while the original ground surface (at the bottom of the embankment) is at approximately elevation 638. The geological information can be found in Appendix E.

II. SUBSURFACE INVESTIGATION

A. Field Investigation

Soil boring and rock core locations are shown on the aerial photography in Appendix F and the typed roadway boring logs, rock core logs and pictures are included in Appendix G. A soil profile is also included in Appendix H.

Precipitation data for the period prior to the subsurface investigation is provided in Table 1 and Table 2. With the actual precipitation being higher than the average for these time periods, groundwater was encountered between elevations 626 to 632, which is well below any proposed roadway improvements. Groundwater is not likely to be encountered during construction and should not be a factor during construction.

Month	Year	Actual Precipitation	Normal Precipitation	Departure from Normal (+/-)	Cumulative Actual Precipitation	Cumulative Normal Precipitation
		inch	inch	inch	inch	inch
May	2016	4.62	4.81	0.19	4.62	4.81

B. Laboratory Testing and Classification of Soils

Laboratory testing consisted of Atterberg Limit determination and grain size analysis. These results are included in Appendix I. Moisture contents were also determined and are indicated on the boring logs. The soil samples were classified in accordance with the IDOT textural classification chart and the AASHTO engineering designations with group indices were determined.

C. Existing Pavement Conditions

The condition of the existing pavement is typical for its age. The pavement does not exhibit any signs of geotechnical failures.

III. ANALYSIS AND RECOMMENDATIONS

A. Frost Susceptible Soils

The soils within the proposed improvement were analyzed for frost susceptibility in accordance to the criteria outlined in the IDOT Geotechnical Manual (2015). The design frost depth for this project is 42 inches. Frost susceptible soils must exhibit at least 65% of silt and fine sand and a plasticity index less than 12.

The results from analysis indicate that no soils with frost susceptible characteristics were encountered in the subsurface exploration.

B. Subgrade Support Rating and Illinois Bearing Ratio

For the purpose of pavement design, a Subgrade Support Rating (SSR) of poor is recommended for all existing subgrade soils. The SSR charts with data points plotted are in Appendix J. Based on Table 6.3.1-1 of the IDOT Geotechnical Manual (2015 edition), the Illinois Bearing Ratio for the existing project soils can be estimated as 3.

The source of the new embankment material is not known at this time, so a Subgrade Support Rating of poor is recommended for all new embankment materials.

C. Slope Stability

The slopes on this project are to be constructed at 2:1 (H:V) or flatter. Slope stability analysis was conducted at station 142+00 using Slide 2018. This station is located near the highest elevation of the embankment and poses the most risk for slope failure based on strength of the soils from the soil boring logs. Based on a factor of safety of 3.3, a slope failure is unlikely to occur so long as the new embankment is benched correctly according to IDOT's Standard Specifications. The slope stability analysis is included in Appendix K.

There were slope failures at the outside approaches on all four structures that were repaired in the early 1990s. The slopes have shown no sign of movement since these repairs took place. Stability is not a concern during construction, however if excavation is to be done in the repaired areas, special care should be taken to prevent the fabric from being torn. If the fabric gets torn the aggregate could potentially spill out and compromise the integrity of the slope. Plans and details from the slope repairs are included in Appendix L.

A side slope stability analysis was also performed by the SGR authors. The lowest calculated factor of safety out of all four proposed structures was 3.0, which is well above the required 1.5. The addition of fill material on the existing embankments is not expected to cause slope stability issues.

Because of the height and profile grades, it is recommended to install a storm sewer system with a curb or curb and gutter to help prevent erosion of the shoulders and side slopes of the proposed embankment.

D. Settlement

The embankment construction consists of building on top of existing embankments which have been in place for many years. The soil borings show high unconfined compressive strengths with relatively low moisture content. With the profile changes the most being built on top of the existing embankments is 5 feet. Settlement calculations were performed and can be found in Appendix M. The most settlement to be expected during construction is 0.25 inches, therefore settlement should not be an issue.

The SGR author also performed a settlement analysis and the maximum settlement to be expected is 0.43 inches, which is not significant. No soil remediation or settlement monitoring is required.

E. Geotechnical Reports

The Roadway Geotechnical Report for this project should be made available to the contractor. A special provision for this is included in Appendix N.

F. Embankment Material

The material to be used for the embankments is not known at this time, however the following requirements must be met:

1. Moisture content shall be between 80% and 110% of the proctor optimum moisture
2. Immediate bearing value of 4.0
3. Liquid limit less than 50
4. Plasticity index greater than 12.0
5. Silt and fine sand content less than 65%

Material not meeting requirements 3, 4, or 5 above shall be restricted to the core of the embankment and must be covered with a minimum of thirty-six inches of material meeting these requirements. This information comes from the District 3 Embankment special provision and the District 3 Borrow and Furnished Excavation special provision which are included in Appendix O and Appendix P respectively.

G. Improved Subgrade

Most of the improvements for this section of I-57 include raising the existing profile, therefore there are no anticipated issues with preparing an improved subgrade. A minimum of 12 inches of Aggregate Subgrade Improvement or subbase granular material type A is recommended throughout the project. These recommendations are based on a review of soil boring logs, laboratory data, and previous experience. A copy of the District 3 Aggregate Subgrade Improvement special provision is included in Appendix Q.

IV. FURTHER INFORMATION

If there are any questions about this report or any additional information is required, please contact the District Geotechnical Engineer.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Kankakee County, Illinois
Survey Area Data: Version 16, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 2, 2015—Jun 9, 2015

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI

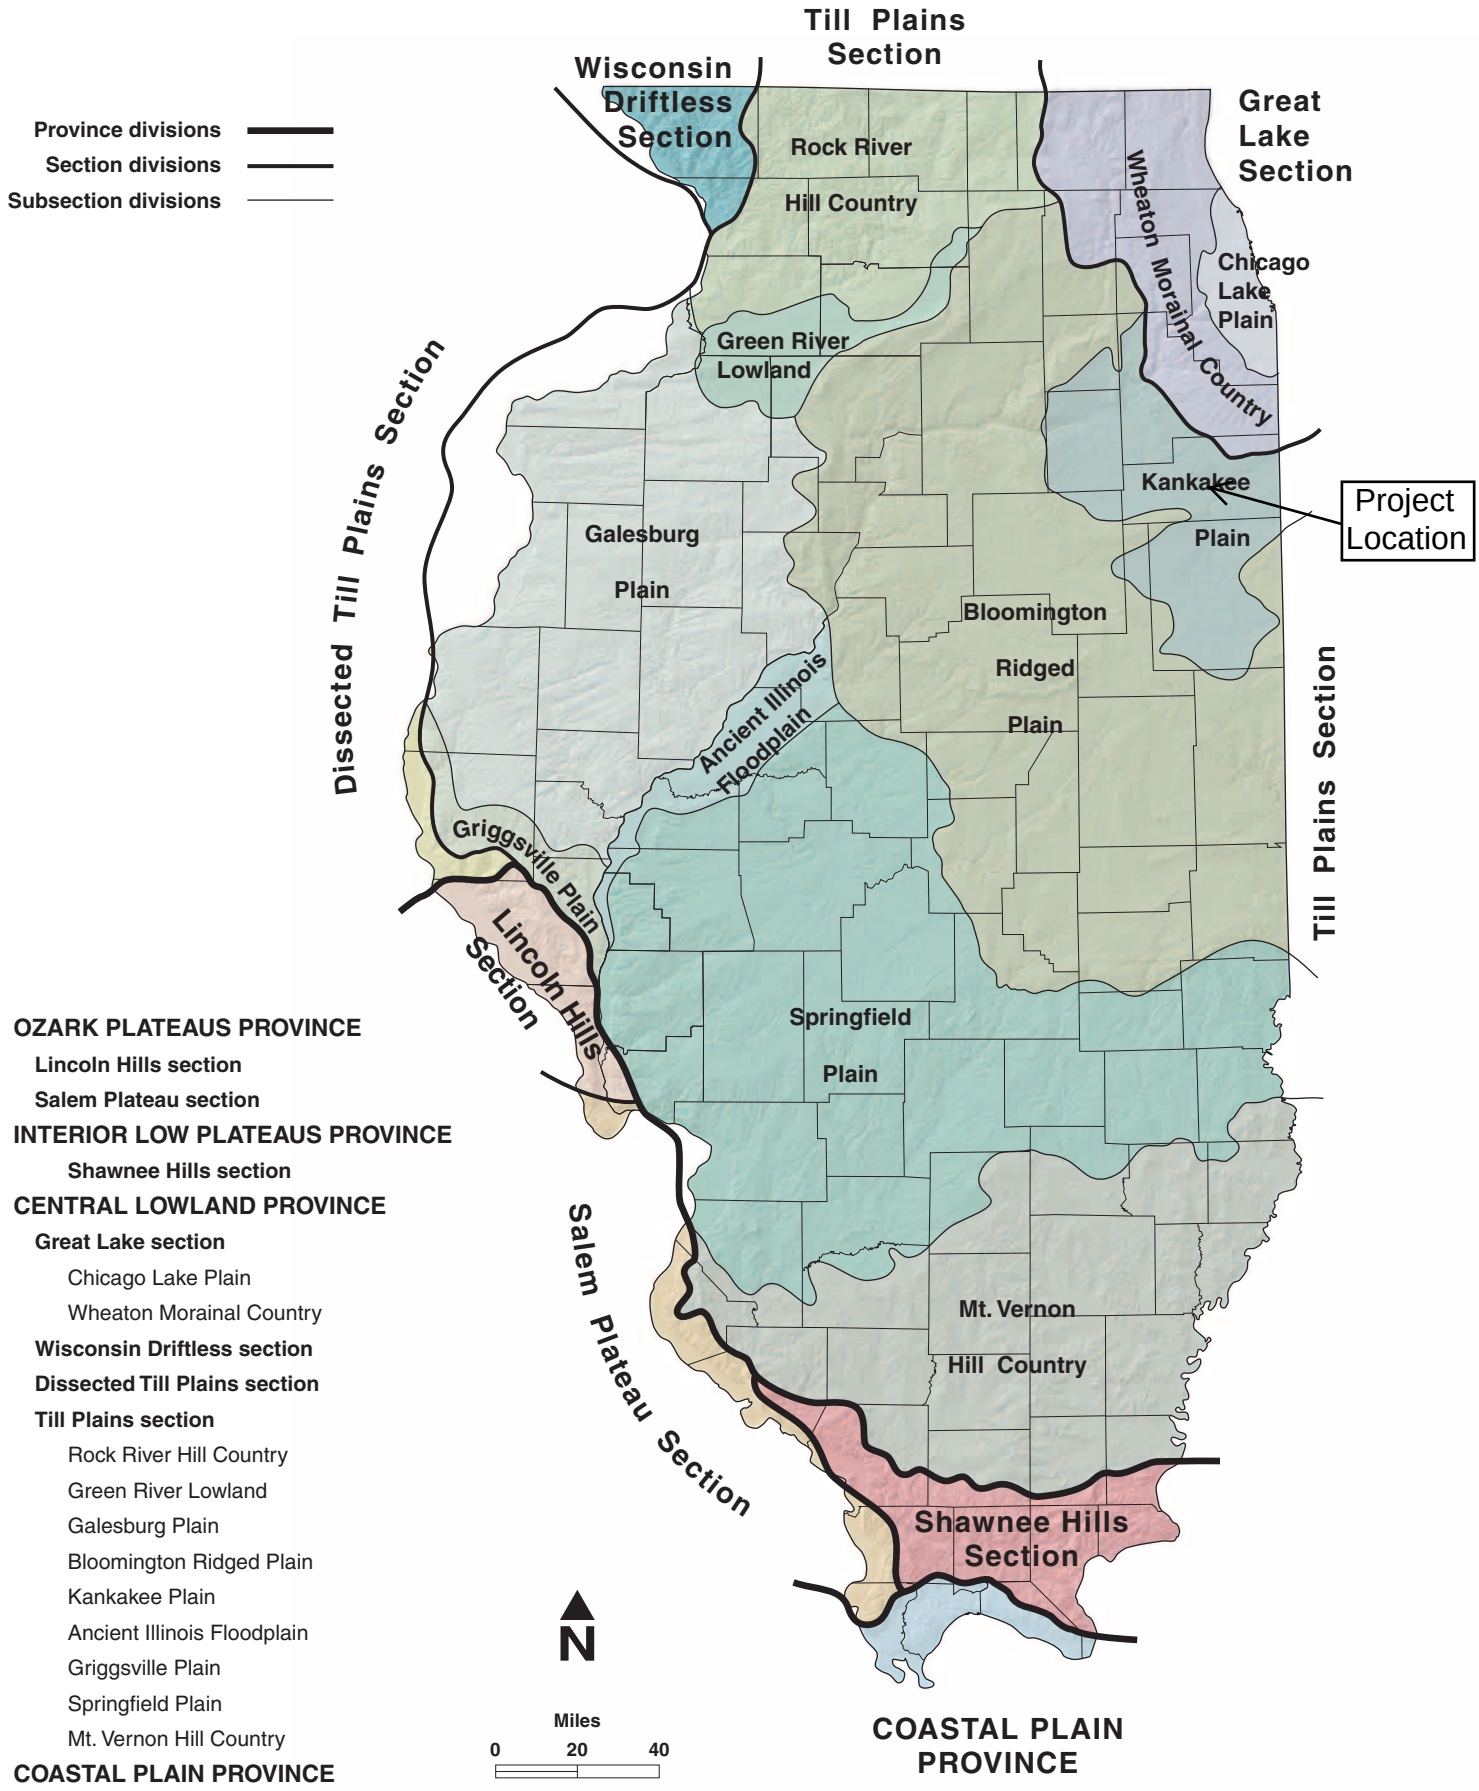
Appendix E

Geological Information

Physiographic Divisions of Illinois



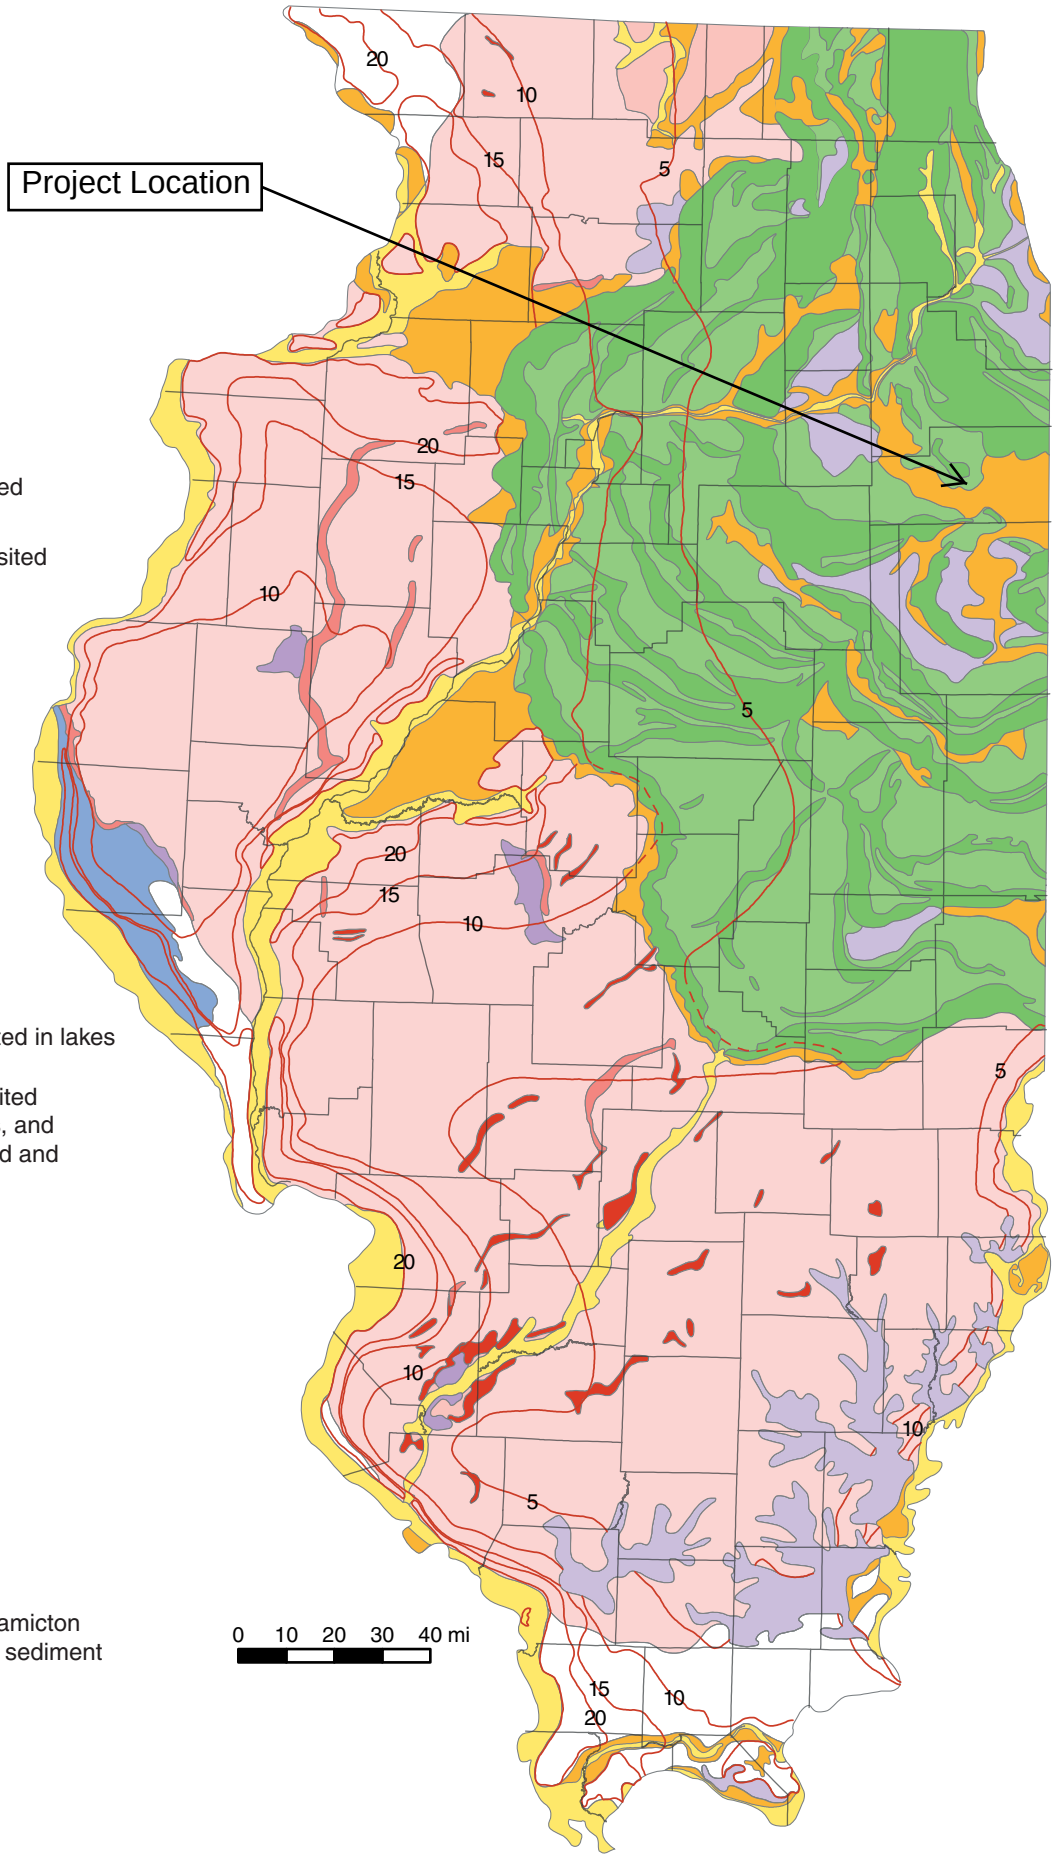
OZARK PLATEAUS PROVINCE
- **Lincoln Hills section**
- **Salem Plateau section**

INTERIOR LOW PLATEAUS PROVINCE
- **Shawnee Hills section**

CENTRAL LOWLAND PROVINCE
- **Great Lake section**
  - Chicago Lake Plain
  - Wheaton Morainal Country
- **Wisconsin Driftless section**
- **Dissected Till Plains section**
- **Till Plains section**
  - Rock River Hill Country
  - Green River Lowland
  - Galesburg Plain
  - Bloomington Ridged Plain
  - Kankakee Plain
  - Ancient Illinois Floodplain
  - Griggsville Plain
  - Springfield Plain
  - Mt. Vernon Hill Country

COASTAL PLAIN PROVINCE

Quaternary Deposits



HUDSON EPISODE

Cahokia Fm; river sand, gravel, and silt

WISCONSIN EPISODE

Mason Group

Thickness of Peoria and Roxanna Silts; silt deposited as loess (5-ft contour interval)

Equality Fm; silt and clay deposited in lakes

Henry Fm; sand and gravel deposited in glacial rivers, outwash fans, beaches, and dunes

Wedron Group (Tiskilwa, Lemont, and Wadsworth Fms) and Trafalgar Fm; diamicton deposited as till and ice-marginal sediment

End moraine

Till plain

ILLINOIS EPISODE

Teneriffe Silt; silt and clay deposited in lakes

Pearl Fm; sand and gravel deposited in glacial rivers and outwash fans, and Hagarstown Mbr; ice-contact sand and gravel deposited in ridges

Winnebago Fm; diamicton deposited as till and ice-marginal sediment

Till plain

Glasford Fm; diamicton deposited as till and ice-marginal sediment

End moraine

Till plain

PRE-ILLINOIS EPISODE

Wolf Creek Fm; predominantly diamicton deposited as till and ice-marginal sediment

Unglaciated

Appendix N

Geotechnical Reports

Special Provisions

Geotechnical Reports
Revised 5-19-2020

A Roadway Geotechnical Report has been prepared for this project. Copies can be obtained by contacting Jeremy Brown, District Geotechnical Engineer, at 1-815-433-7098 or Jeremy.Brown@Illinois.gov.

Appendix O

Embankment (District 3)

Special Provision

2D

EMBANKMENT

(Effective July 1, 1990; Revised July 23, 2018)

This work shall be performed in accordance with Section 205 of the Standard Specifications except the embankment material shall not be placed and compacted at moisture contents in excess of 110 percent of optimum moisture unless authorized, in writing, by the Engineer.

Topsoil material shall not be placed in the embankment within 12 inches (300 mm) of the pavement structure.

DESIGNER NOTE:

To be included on all projects involving earthwork compaction when measurement will be other than truck count.

Appendix P

Borrow and Furnished Excavation (District 3) Special Provision

2B

BORROW AND FURNISHED EXCAVATION
(Revised January 1, 2010)

In addition to the requirements of Section 204 of the Standard Specifications for suitable materials, the following restrictions shall apply:

1. The moisture content of the material as it is incorporated into the embankment shall be between 80% to 110% of AASHTO T99 optimum.

2. A 3 ft. (1 m) minimum cover of other suitable material shall be maintained outside of and on top of the embankment.

3. If the liquid limit of the material is greater than or equal to 50, the material shall not be used for capping, shall not be placed within 20 feet of any structure, and shall not be placed in locations where it may come into contact with water.

4. Embankment capping material (as outlined in #2) shall meet non-frost susceptibility criteria as outlined in the statewide Geotechnical Manual. Materials are considered frost susceptible when the soil contains at least 65% silt and sand content, according to AASHTO T88 and the Plasticity Index is less than 12.

DESIGNER NOTE:

To be used when requested by Bureau of Project Implementation.

Appendix Q

Aggregate Subgrade Improvement (District 3) Special Provision

3A

AGGREGATE SUBGRADE IMPROVEMENT (District 3)
(Effective April 1, 2012; Revised July 8, 2019)

Add the following Section to the Standard Specifications:

"**SECTION 303. AGGREGATE SUBGRADE IMPROVEMENT**

303.01 Description. This work shall consist of constructing an aggregate subgrade improvement.

303.02 Materials. Materials shall be according to the following.

Item	Article/Section
(a) Coarse Aggregate	1004.07
(b) Reclaimed Asphalt Pavement (RAP) (Notes 1, 2, and 3)	1031

Note 1. Crushed RAP, from either full depth or single lift removal, may be mechanically blended with aggregate gradations CS 01 or CS 02 but shall not exceed 40 percent of the total product. The top size of the RAP shall be less than 4 in. (100 mm) and well graded.

Note 2. RAP having 100 percent passing the 1 1/2 in. (37.5 mm) sieve and being well graded, may be used as capping aggregate in the top 3 in. (75 mm) when aggregate gradations CS 01 or CS 02 are used in lower lifts. The RAP shall not be gap graded, single sized, or have a maximum size of less than 3/4 in. (19 mm).

Note 3. The RAP used for aggregate subgrade improvement shall be according to the current Bureau of Materials and Physical Research Policy Memorandum, "Reclaimed Asphalt Pavement (RAP) for Aggregate Applications".

303.03 Equipment. The vibratory machine shall be according to Article 1101.01 or as approved by the Engineer.

303.04 Soil Preparation. The stability of the soil shall be according to the Department's Subgrade Stability Manual for the aggregate thickness specified.

303.05 Placing Aggregate. The maximum nominal lift thickness of aggregate gradations CS 01 and CS 02 shall be 24 in. (600 mm).

303.06 Capping Aggregate. The top surface of the aggregate subgrade shall consist of a minimum 3 inches (75 mm) of aggregate gradations CA 06 or CA 10.

303.07 Compaction. All aggregate lifts shall be compacted to the satisfaction of the Engineer. If the moisture content of the material is such that compaction cannot be obtained, sufficient water shall be added so that satisfactory compaction can be obtained.

303.08 Finishing and Maintenance of Aggregate Subgrade Improvement. The aggregate subgrade improvement shall be finished to the lines, grades, and cross

sections shown on the plans, or as directed by the Engineer. The aggregate subgrade improvement shall be maintained in a smooth and compacted condition.

303.09 Method of Measurement. This work will be measured for payment according to Article 311.08.

303.10 Basis of Payment. This work will be paid for at the contract unit price per square yard (square meter) for AGGREGATE SUBGRADE IMPROVEMENT, of the thickness specified."

Add the following to Section 1004 of the Standard Specifications:

"**1004.07 Coarse Aggregate for Aggregate Subgrade Improvement.** The aggregate shall be according to Article 1004.01 and the following.

(a) Description. The coarse aggregate shall be crushed gravel, crushed stone, or crushed concrete.

(b) Quality. The coarse aggregate shall consist of sound durable particles reasonably free of deleterious materials.

(c) Gradation.

(1) The coarse aggregate gradation for total subgrade thickness less than or equal to 12 inches (300 mm) shall be CS 02.

The coarse aggregate gradation for total subgrade thickness more than 12 inches (300 mm) shall be CS 01 or CS 02.

	COARSE AGGREGATE SUBGRADE GRADATIONS				
Grad No.	Sieve Size and Percent Passing				
	8"	6"	4"	2"	#4
CS 01	100	97 ± 3	90 ± 10	45 ± 25	20 ± 20
CS 02		100	80 ± 10	25 ± 15	

	COARSE AGGREGATE SUBGRADE GRADATIONS (Metric)				
Grad No.	Sieve Size and Percent Passing				
	200 mm	150 mm	100 mm	50 mm	4.75 mm
CS 01	100	97 ± 3	90 ± 10	45 ± 25	20 ± 20
CS 02		100	80 ± 10	25 ± 15	

(2) The 3 inch (75 mm) capping aggregate shall be gradation CA 6 or CA 10."

DESIGNER NOTES:

Replaces BDE Special Provision - Do NOT check BDE Special.

Must obtain prior approval from Materials if using a thickness less than 12” or greater than 24”.

Must include BDE Special Provision for Reclaimed Asphalt Pavement (RAP) and Reclaimed Asphalt Shingles (RAS).

Underdrains are required when using this pay item and are paid for separately.

Pay for Geotextile Fabric for Ground Stabilization as a separate pay item if used.
