

Abbreviated Structure Geotechnical Report

Original Report Date: 7-29-2020 Proposed SN: 046-0160 Route: FAP 330 (US 45/52)
Revised Date: _____ Existing SN: 046-0046 Section: 16 BR-1
Geotechnical Engineer: Mark Jones of McCleary Engineering County: Kankakee
Structural Engineer: William Vegrzyn of V3 Companies Contract: 66H54

Indicate the proposed structure type, substructure types, and foundation locations (attach plan and elevation drawing): The proposed structure SN046-0160 is a three-span structure with integral abutments and solid wall piers. Drilled shafts are proposed for the pier foundations. The end spans are 33.0 ft. long and the center span is 40 ft. long. The out to out superstructure width is 42.83 ft. and the back to back abutment length is 109.79 ft. The estimated factored loading at the abutments is 840 kips; 750 kips at the piers. The skew is 15° and the estimated width of the substructure unit is 44.35 ft. See attached TSL drawing for further information

Discuss the existing boring data, existing plans foundation information, new subsurface exploration and need for any additional exploration to be provided with SGR Technical Memo (attach all data and subsurface profile plot): Four borings were taken in 1967. The borings are not very deep, ranging from 6 ft. to 15 ft. before refusal. The borings show anywhere from 5 ft. to 8.5 ft. of overlying Sand, Clay, Silty Clay, and Silty Loam, most with Limestone Fragments. All 4 borings reported a base layer of Limestone rubble or very dense thinly to moderately bedded Argillaceous Limestone. The thickness of this base layer varied from 1 ft. to 8.5 ft. before refusal. The depth of refusal varied between elevations of 642.19 ft. and 647.79 ft.

Two borings were taken in March of 2018, Boring 01 (S.E. Quad) and Boring 02 (N.W. Quad). Both borings exhibited a similar soils, with ±7 ft. of Stiff to Very Stiff Silty Clay Loam Fill with Gravel and Asphalt pieces, and Concrete debris over ±6 ft. Stiff to Very Stiff Silty Loam and Loamy Sand and Gravel. Beneath this, Boring 01 had 2 ft. of Hard Black Clay (Eroded Reworked Coal?) over ±7.5 ft. of Hard Silty Clay – Silty Calcareous Shale with Coal Pieces. Boring 02 had 5 ft. of Dense Calcareous Shale with Limestone Gravel and Fragments. Both borings ended with 3 to 4 ft. of Dense Silty Calcareous Shale with Limestone Layer and Pieces. The borings ended in this last layer when the blow counts reached 100 or more per 4 inches. Boring 01 was terminated at 635.68 ft. and Boring 02 was terminated at 641.21 ft. The groundwater elevation was 650.5 ft. and 651.4 ft. in Boring 01 and 02, respectively.

Six cores were taken. Two taken by State personnel; Core 03 (N.E. Quad) and Core 04 (S.W. Quad.) at the abutments in May of 2020. Four more borings/cores (Identified in this report as Wang Borings, B-01 through B-04 because of the repeating nomenclature) were taken each side of the 2 proposed piers in June of 2020. They reveal a dramatically varied bedrock surface, possibly an erosional surface, with dense to very dense limestone and shale, and medium dense to very dense siltstone. Elevations of the top of limestone varied from 627.3 to 645.87. Wang Boring B-02 reported only Siltstone while the 5 other cores/borings reported only Shale over Limestone (State Core 03 (N.E. Quad) reported Limestone over Shale). The reported bedrock elevations would indicate a sloping west to east surface except that Core 03 (N.E. Quad.) on the east side reported the highest surface of limestone found (645.87). Note this core is less than 20 ft. away from Wang Boring B-04, which reported the lowest top of limestone, 627.8 ft.

McCleary Engineering (McE) feels that more information is required to define the top of rock surface. Without further subsurface exploration of the variable top of rock McE cannot making meaningful estimates which will lead to construction delays and cost over-runs as redesigns of the foundations are developed. Especially troublesome are the Pier borings/cores. Drilled shafts would be advantageous at the pier locations because of the stream and a nearby top surface of rock. Pier 1 shows only siltstone on the west side of the pier—the east side shows the top of limestone at 637.8. Also note that Core 4 is less than 15 ft. from Wang Boring B-02 and it show a top of limestone at 643.22 ft., about a 17 ft. difference. The Wang Borings at Pier 2 both report a limestone surface, but the difference in elevation is concerning (also about 17 ft.).

McE recommends additional 15 ft. cores be taken at the roadway centerline along Pier 1 and Pier 2 to try and establish a more accurate profile of the top of limestone surface. More exploration of the siltstone reported at Wang Boring B-02 is needed. If limestone could be found within a reasonable depth, McE could be consistent with recommending sockets in the limestone. Without discovery of the limestone, unconfined compressive strengths of the siltstone are required to develop accurate side and tip resistances in the siltstone. See the attached 1967 and 2018 borings, the 2020 cores, and the 2020 Wang Borings/cores. Also attached is a comparison between the old and new borings with further thoughts on the current status of subsurface exploration.

The as built plans for the existing structure, SN 046-0046, show a ±85 foot 3-span bridge on closed abutments and solid stem piers supported on spread footings. As-built plans show the bottom of the spread footings at an elevation of 647.63 ft. (Pier 2 shows an elevation of 647.60 ft.) Routine bridge inspections did not report any critical scour or bridge settlement.

Provide the location and maximum height of any new soil fill or magnitude of footing bearing pressure. Estimate the amount and time of the expected settlement. Indicate if further testing, analysis, and/or ground improvement/treatment is necessary: The proposed roadway will retain the same vertical and horizontal alignment as the existing roadway. The existing bridge has been in place since 1967 and shows no settlement problems. Future settlement is of minimal concern.

Identify any new cuts or fill slope angles and heights. Estimate the factor of safety against slope failure. Indicate if further testing, analysis or ground improvement/treatment is necessary: The current structure (±85 ft. b-b) has closed abutments, the proposed structure (±110 ft. b-b) will utilize open spill-through abutments and will require removal of the material behind the existing abutments. Following state policy, it is expected that after construction the new end slopes will be 2:1 (H:V) and lined with Class A4 or A5 stone riprap. A temporary slope stability analysis was completed using Slide for the temporary end slopes. Using the information from boring SB-01 (S.E.Quad.) in an undrained condition the proposed 2:1 end slope will have a factor of safety against a slope failure of 4.912

Indicate at each substructure, the 100-year and 200-year total scour depths in the Hydraulics report, the non-granular scour depth reduction, the proposed ground surface, and the recommended foundation design scour elevations: The abutments were not evaluated for scour in accordance with IDOT policy. Spill through abutments shall be protected by riprap or slope wall. The Thalweg has an elevation of 651.0 ft. The unadjusted scour depths are as follows; Q_{100} scour depth = 16.54 ft. and Q_{200} scour depth = 15.83 ft.

Pier Scour: Two borings/cores were taken at each pier, the worst case was used to determine the scour depth; for Pier 1 (south pier); below the Thalweg elevation is 0.7 feet of soft to very soft Silt Loam, Loam, and Clay Loam (zero geotechnical reduction in scour). Then a ≥ 19.5 ft. layer of siltstone was reported. The top of the siltstone has an estimated Q_U of 2.4 tsf (say 50% geotechnical reduction in scour, the second “layer”; 50%, third “layer”; 75%). See attached calculations and Siltstone sample pictures. The recommended design scour elevation for the south pier is 645.1. The recommended check scour elevation would be 645.3 ft.

For Pier 2 (north pier), under a foot and a half of Gravel (zero geotechnical reduction in scour), a minimum 6.5 ft. of dense to very dense, weathered to highly weathered shale was reported (90% geotechnical reduction in scour). With a Thalweg of 651.0 and using B-01 as the worst case boring/core, the recommended design scour elevation for the north pier is 648.0. The recommended check scour elevation would be 648.1 ft.

A geotechnical reduction in the scour depths for Pier 1 and Pier 2 was applied and the results are shown in the Design Scour Table below.

Event/Limit	Design Scour Elevations (ft.)				Item
	S. Abut	Pier 1	Pier 2	N. Abut.	
State					113
Q100	-	645.10	648.00	-	5
Q200	-	645.30	648.10	-	
Design	656.65	645.10	648.00	656.62	
Check	656.65	645.30	648.10	656.62	

Determining the seismic soil site class, the seismic performance zone, the 0.2 and 1.0 second design spectral accelerations and indicate if that the soils are liquefiable: This site has a seismic site class of “C”, the seismic performance zone (SPZ)=1. The S_{DS} = 0.124 and an S_{D1} =0.07. Due to the S_{D1} being less than 0.15 g, a liquefaction analysis was not performed.

Confirm feasibility of the proposed foundation or wall type and provide design parameters. Attach a pile design table indicating feasible pile types, various nominal required bearings, factored resistances available and corresponding estimated lengths at locations where piles will be used. Provide factored bearing resistance and unit sliding resistance at various elevations and confirm no ground improvement/treatment is necessary where spread footings are proposed. Estimated top of rock elevations as well as preliminary factored unit side and tip resistance values shall be indicated when drilled shafts are proposed: Data from the two March 2018 borings, Boring 01 (S.E. Quad) and Boring 02 (N.W. Quad) was used to populate the data fields in the Estimated Pile Length spreadsheets. Boring 01 was used for the north abutment and Boring 02 was used for the south abutment. These borings satisfactorily represent soil layers at the proposed substructure locations.

Data from the two 2018 borings, 01 (S.E. Quad.) and 02 (N.E. Quad.) were used to populate the data fields in the Estimated Pile Length Spreadsheets. Total factored loading for the abutments is 840 kips.

Integral Abutments – At the abutments McE recommends the use of H Piles with metal shoes driven to refusal. The BBS 145 Integral Abutment worksheet was used to analyze the soils. McE used the data from the 2018 borings, Boring 01 (S.E. Quad.) and Boring 02 (N.W. Quad.) to populate the fields in the integral abutment worksheet. The results show the abutment soils would allow the required movement for integral abutments and no remediation is required. The numerous layers with Gravel and Limestone pieces, as well as the Asphalt and Concrete debris dictate the need for metal shoes for the piles. Boring 01 (S.E. Quad.) indicate hard soils starting at elevation 649.0 ft., but the relatively lower blow counts indicate drive-ability. The calculated settlement is negligible; therefore, down drag was not used in the analysis. Also, the site is in a SPZ 1, therefore, liquefaction was not considered. Due to the inconsistent boring results, two test piles are recommended, one should be driven at each abutment. See the appendix for pile tables and spreadsheets for all common size H-Piles.

Top of Rock elevations vary dramatically. The top of rock was taken from the 4 Wang borings--the top of rock for Boring B-02 was taken to be the top of the Siltstone where the increase in blow counts was dramatic (from 28 to over 100). Top of Rock elevations are as follows:

Pier 1 East Side	Wang Boring B-03	637.8
Pier 1 West Side	Wang Boring B-02	645.8
Pier 2 East Side	Wang Boring B-04	627.3
Pier 2 West Side	Wang Boring B-01	644.4

Assumptions used for the pile length analysis include:

- Bottom of North and South Abutment Elevation are respectively = 656.62 and 656.65.
- The factored loading for the Abutments is 840 kips and 750 kips for the piers.
- The pile cutoff elevation allows for a 2 ft. embedment into concrete for the integral abutments.
- No geotechnical losses were accounted for in the abutment analyses.

Drilled Shafts -- Design methods used for this report are discussed in FHWA Publication No. FHWA-NHI-10-016 for Drilled Shafts: Construction Procedures and LRFD Design Methods. Chapter 13 equations were used to develop side and base resistances for the boring at the west side of Pier 1 (Wang Boring B-02) in the Siltstone. See attached hand calculations in the appendix. The IDOT BBS 141 spreadsheet for Drilled Shaft Axial Capacity In Rock was used to evaluate the side and tip resistances for the 3 remaining pier cores, the east side of Pier 1 and the east and west sides of Pier 2. See attached Drilled Shaft Design tables for Wang Borings B-01, B-03, and B-04.

Calculate the estimated water surface elevation and determine the need for cofferdams (type 1 or 2), and seal coat: The E.W.S.E is 653.8 ft. The use of drilled shafts with web walls would preclude the need for a cofferdam for pier construction.

Assess the need for sheeting or soil retention or temporary construction slope and provide recommendation for other construction concerns: At this time, McE anticipates the structure to be built under staged construction conditions; due to the shallow depth of bedrock, a temporary retention system with need to be required at the stage line. The existing substructures shall be removed as per Section 501 of the 2016 IDOT Standard Specifications for Road and Bridge Construction.

Location Map

Benchmark: BM 14: Rivet on top of the NE wingwall of SN 046-0046; Elev. 661.91

Existing Structure: SN 046-0046 was originally constructed in 1967 as F.A. 45, Section 16 BR-1 at Station 517+09. The existing 3-span reinforced concrete slab superstructure is supported by closed abutments on spread footings and solid wall piers on spread footings. The outer spans are 24'-7" and the middle span is 30'-10" with a 15 degree skew. The back-to-back of abutments measure 84'-10" and the out-to-out width is 46'-6". The existing structure will be removed and replaced utilizing staged construction.

No salvage.

* Fracture Types:

- Type 1 - Reasonably well-formed cones on both ends, less than 1 in. [25 mm] of cracking through caps;
- Type 2 - Well-formed cone on one end, vertical cracks running through caps, no well defined cone on other end;
- Type 3 - Columnar vertical cracking through both ends, no well-formed cones;
- Type 4 - Diagonal fracture with no cracking through ends; tap with hammer to distinguish from Type 1;
- Type 5 - Side fractures at top or bottom (occur commonly with unbonded caps);
- Type 6 - Similar to Type 5 but end of cylinder is pointed.

			200/0"			

Note:

- Blow counts are likely different because we use automatic hammers now and they used a cathead.
 - However, the stark differences between the blow counts that we encountered in 2018 at say 648.88 ft. Elev. (10-20-30) compared to that in 1967 of (100/3") at 647.79 Elev. are dramatic. The rock in this area may be an erosional surface where at a particular location the rock is high and 3 ft. away the rock drops 7 ft. and 3 ft. away from the low rock the rock rises again to the elevation of the original boring. I don't usually see it this far away from the Kankakee River
- Auger refusal may differ between the rigs. Not sure what rig they were using back in 1967 compared to the rigs you have in your fleet today.
- The issue is that we would probably recommend driven H-piles using the new borings, but with the 1967 borings we would go with a spread footing or drilled shaft foundations.

Q_u estimate from BBS-145

$$16.54' = 0.7' + 2.5' + 2.5' + x / (1 - 0.75)$$

$$16.54 = 5.7 + 4x$$

$$10.84 = 4x$$

$$x = 2.71$$

Scour Elev Calcs

Fier 1 total geotech scour depth

<ul style="list-style-type: none"> • $1 \times 0.7 = 0.7'$ dams • $.5 \times 2.5 = 1.25$ siltstone @ 50% R • $.5 \times 2.5 = 1.25$ siltstone @ 50% R • <u>2.71</u> siltstone @ 75% R 	<ul style="list-style-type: none"> • $5.91 \text{ ft} = Q_{100}$ scour depth ✓ • $651.0 - 5.9' = \underline{645.1} = Q_{100}$ scour elev ✓
--	--

Similarly for Q_{200}

- $15.83 = 5.7 + 4x$
- $x = 2.53' \therefore 5.7 = Q_{200}$ scour depth
- $651.0 - 5.7 = \underline{645.3} = Q_{200}$ scour elev ✓

Pier 2 North Pier

Wang Engr. Log $\Delta 1 \leftarrow$ worst case
04

$$Q_{100} \quad 16.5 \text{ ft} = 1.5' + X / (1 - 0.9)$$

$$15.04 = 10X$$

$$X = 1.50' \therefore Q_{100} \text{ SD} = 1.5' + 1.5' = 3.0'$$

$$651.0 - 3.0' = 648.0 = Q_{100} \text{ scour elev}$$

$$Q_{200} \quad 15.83 = 1.5 + 10X$$

$$X = 1.43' \therefore 2.93' = Q_{200} \text{ scour depth}$$

$$651.0 - 2.93' = 648.1' = Q_{200} \text{ scour elev.}$$

US 45 Bridge over Rock Creek Scour Depth Summary

Resistance in Siltstone

assume ave $N = \frac{50}{4''} \sim 150$

use BBS 145 spread sheet

$N = 150 \rightarrow Q_u = 4.5 \text{ tsf}$

$Q_{u/2} = S_u \rightarrow S_u = 4.5 \text{ ksf}$

→ for side resistance $P_a = 2116 \text{ psf}$

$\frac{S_u}{P_a} = \frac{4500}{2116} = 2.13 \checkmark$

$\alpha = 0.55 - 0.1 \left(\frac{S_u}{P_a} - 1.5 \right)^{.06}$ when $\frac{S_u}{P_a} > 1.5$
 $\alpha = 0.49 \checkmark$

unit side resistance = $f_{sN} = \alpha \times S_u$

$f_{sN} = 0.49 \times 4500 \text{ psf} = 2,205 \text{ psf} \checkmark$

factored unit $f_{sN} = 0.55 \times \frac{2205 \text{ psf}}{1000} \text{ ksf}$
 $= \underline{1.21 \text{ ksf}}$

Resistance in Siltstone

for base resistance $Q_{BN} = N_c^* S_u$

$$S_u = 4500 \text{ psf}$$

$$N_c^* = 9.0 \text{ (p. 13-17 FHWA Drilled Shafts Man.)}$$

$$Q_{BN} = 9 \times 4500 = 40,500 \text{ psf} \checkmark$$

factored base resistance

$$= \frac{0.55 \times 40,500}{1000 \frac{\text{psf}}{\text{ksf}}} = \underline{22.28 \text{ ksf}} \checkmark$$

Proposed

Bridge

Abutment Type	Open Abutment	
# Spans	3	
Length (ft)	109'-9 9/16"	BK-BK
Skew	15	RT-AH
Low E.O.P.	659.98	
Low Beam	659.96	
US Flowline	651.0	
DS Flowline	651.0	

Note(s)

Ex. span configuration: 24'-7"/30'-10"/24'-7" (ctr-ctr). Ex. bridge width: 46'-6" out-out
 Pr. span configuration: 33'-0"/40'-0"/33'-0" (ctr-ctr). Pr. bridge width: 42'-10" out-out

Proposed structure details are preliminary; subject to refinement in TSL stage.

See Floor Drains at the bottom of page 2-67 of the Bridge Manual.

Vertical Curve

$L=305$

$g_1= +1.31\%$

$g_2= -1.36\%$

$K=L/(g_2-g_1) = 305/(-1.36-1.31) = 114 < 167$ Therefore no Floor Drains are needed
