
Geotechnical Memorandum

To: Mr. Amish T. Bhatt, S.E., P.E., AECOM
From: Met Seyhun, P.E., Sr. Geotechnical Engineer/Project Manager
Date: July 11, 2019
Subject: Retaining Wall 32 along NB Washington Exit Ramp, SN 016-1821
F.A.I RTE. 90/94 (Kennedy Expressway), Station 8680+65.00 to 8683+00.00
Section 2015-019R, IDOT Contract No. 62A76
Project: Jane Byrne (Circle) Interchange Reconstruction – Cook County, Illinois
Wang No: 1100-04-01

INTRODUCTION

This memorandum presents the results of our geotechnical subsurface investigation, laboratory testing, engineering analyses, and recommendations for the proposed retaining wall, designated as SN016-1821 (Retaining Wall 32) in the City of Chicago, Cook County, Illinois. On the USGS *Chicago Loop Quadrangle 7.5 Minute Series* map, the investigated area is located in the NW¹/₄ of Section 16 of Tier 39 N, Range 14 E of the Third Principal Meridian. A *Site Location Map* is presented as Exhibit 1.

Based on the Type, Size, and Location (TSL) plan dated June 26, 2019 provided by TranSystems Corporation (TranSystems), Wang Engineering, Inc. (Wang) understands the proposed Retaining Wall 32 will be a drilled soldier pile wall type to support the northbound (NB) Washington Street Exit Ramp. The 235.4-foot long wall will begin at Station 8680+65.00 with an offset of 12.38 feet right and end at Station 8683+00.00 with an offset of 2.00 feet right. The wall will have a Kink point at Station 8682+00 and a maximum retained height of 6.3 feet. The TSL plan is included in Appendix D.

SUBSURFACE INVESTIGATION AND LABORATORY TESTING

Between June and October 2014, Wang performed three structure borings, designated as 32-RWB-01 through 32-RWB-03 and 32-RWB-03B, one shelly tube boring, designated as 32-ST-01. Boring 32-RWB-03 was attempted twice due to obstruction. To supplement our investigation, we considered nearby structure Boring 33-RWB-01 drilled in June 2014. We also considered vane shear test Boring VST-03 located about 290 feet south of the Madison Street Bridge. The borings were advanced from elevations 577.40 to 593.21 feet to depths of 8.5 to 65.0 below the ground surface (bgs). The as-drilled boring locations were surveyed by Dynasty Group, Inc. and station and offset

for each boring were provided by AECOM. The as-drilled boring location data are presented in the *Boring Logs* (Appendix A) and as-drilled boring locations are shown in the *Boring Location Plan* (Exhibit 2).

Truck-mounted drilling rigs, equipped with hollow stem augers were used to advance and maintain an open borehole to 9.5 to 11 feet depths after that mud rotary was used to the boring termination depth. Soil sampling was performed according to AASHTO T206 “*Penetration Test and Split Barrel Sampling of Soils.*” The soil was sampled at 2.5 to 5-foot intervals to boring termination depths. Vane shear tests were performed in undisturbed and remolded conditions using calibrated RocTest vane shear equipment.

Field boring logs prepared and maintained by a Wang geologist, include lithological descriptions, visual-manual soil classifications, results of Rimac and pocket penetrometer unconfined compressive strength tests, and results of Standard Penetration Tests (SPT) recorded as blows per 6 inches of penetration. The SPT N value, shown on the *Subsurface Soil Data Profile* (Exhibit 3) is the sum of the second and third blows per 6 inches. The soils were described and classified according to the Illinois Division of Highways (IDH) Textural Classification system.

The soil samples were tested in the laboratory for moisture content (AASHTO T265). Atterberg limits (AASHTO T89/T90) and particle size analyses (AASHTO T88) tests were performed on selected soil samples representing the main soil layers encountered during the investigation. Shelby tube samples from Borings 32-RWB-03B and 32-ST-01 were tested for unconfined compressive strength (T208), triaxial unconsolidated undrained compression (T296), and one-dimensional consolidation (T216). Field visual descriptions of the soil samples were verified in the laboratory. Laboratory test results are shown in the *Boring Logs* (Appendix A), in the *Soil Profile* (Exhibit 3), and in the *Laboratory Test Results* (Appendix B).

RESULTS OF FIELD AND LABORATORY INVESTIGATIONS

Detailed descriptions of the soil conditions encountered during our subsurface investigation are presented in the attached Boring Logs (Appendix A), and the borings locations are shown in the Boring Location Plan (Exhibit 2).

Surface and Soil Conditions

At the surface, the borings encountered 4-to 12-inch thick asphalt over 8-to 14-inch thick concrete followed by crushed stone aggregate base.

Beneath the surface, the borings encountered 2 to 10 feet of fill materials. The fill consists of medium stiff to very stiff silty clay to silty clay loam with unconfined compressive strength (Q_u) values of 0.5 to 2.3 tsf and very dense sandy gravel with N values of 44 to over 50 blows per foot.

Below the fill at elevations of 573 to 583 feet (3 to 10 feet bgs), the borings encountered up to 36 feet of very soft to medium stiff clay to silty clay (Chicago Blue Clay) with Q_u values of 0.08 to 0.82 tsf and moisture content values of 21 to 31%. Laboratory unconsolidated undrained triaxial tests show shear strength values of 288 to 720 psf. Laboratory index testing on samples from this layer showed liquid limit (L_L) values of 32 to 39% and plastic limit (P_L) values of 15 to 18%. In-situ undisturbed vane shear strengths obtained in Borings 32-RWB-01 and VST-03 between elevations 574 and 542 feet ranged from 370 to 1680 psf.

Beneath the clay to silty clay, the borings encountered stiff to very stiff silty clay to silty clay loam extending to the boring termination depths.

Groundwater Conditions

Borings were observed to be dry during drilling or after drilling within the 9.5 to 11 bgs. After that the mud rotary drilling was used and groundwater on deeper levels could not be observed. Groundwater may be perched within the granular fill layers. Water-bearing silt and gravel layers may also be present at deeper levels.

A Piezometer 30-PZ-01 was installed for the nearby structure about 550 feet south of the proposed retaining wall 32 on November 21, 2014 and monitored until March 2017. The screen was placed with the top and bottom elevations at 503.7 and 493.7 feet (89.5 to 99.5 feet bgs), respectively within granular layers above bedrock. Piezometer readings show an average water table elevation of 545.8 feet indicating under hydrostatic pressure within the granular deposit encountered on top of the bedrock.

Although the groundwater was not observed within upper fill layers, we anticipate perched water may be encountered during times of heavy precipitation. Therefore, the design and construction of the wall should consider the perched water between 588 and 581 feet elevations within the fill layers.

ANALYSIS AND RECOMMENDATIONS

We recommend drilled soldier piles should be designed for both lateral earth pressure and lateral deformation. The embedment depth in moment equilibrium for the wall section should be designed in accordance with the LRFD guidelines (AASHTO 2017). Generally, overconsolidated clayey soils, such as the stiff to very stiff clays and very dense silty loam will exhibit lower overall shear strength in the long-term condition; normally-consolidated clayey soils, however, such as the very soft to medium stiff clay to silty clay (Chicago blue clay) will likely exhibit significantly lower shear strength in the short-term condition. Therefore, the lateral earth pressure analysis should be performed for walls in both the short-term (undrained) and long-term (drained) condition using the soil parameters shown in Tables 1 and 2.

The design of the wall should ignore 3 feet of soil in front of the wall measured from the finished ground surface elevation in providing passive pressure due to excavation required for installation

of concrete facing, drainage system and frost-heave condition. In developing the design lateral pressure, the lateral pressure due to construction equipment surcharge load should be added to the lateral earth pressure. Drainage behind the wall and underdrain should be as per IDOT Bridge Manual (IDOT 2012). The water pressure should be added to the earth pressure if drainage is not provided. The potential foundation pressure/load from the existing building on the proposed wall should be considered in design of the wall.

Table 1: Undrained Geotechnical Parameters for Design of Drilled Soldier Pile Wall

Global Stability

Global stability analysis was performed at Station 8681+75.00 for the maximum wall retained height of about 6.7 feet. Analysis was performed with *SLIDE Version 6* computer software. The minimum required FOS is 1.5 (IDOT 2015). With a 4-foot of the soldier pile embedment, the minimum factor of safety (FOS) calculated were 1.68 (Appendix C-1) for the undrained condition and 1.77 (Appendix C-2) for the drained condition. Results of global stability analyses are presented in Appendix C. The designer should perform the lateral load analyses using earth pressure diagram and allowable deflection to determine the final embedment depth.

CONSTRUCTION CONSIDERATIONS

Groundwater level measurements were made in the borings at the time of drilling and monitor in piezometer 30-PZ-01. The granular fill soils may exhibit perched groundwater conditions. These layers may be intercepted during shallow excavations. Seepage water that does accumulate in open excavations above groundwater level can be removed using the sump pump method. Intermittent water-bearing layers may also present at deeper levels within the proposed drilled piles.

The soft soil layer with Q_u less than 0.5 tsf (500 psf cohesion) is prone to squeeze if left open for long period of time. Therefore, to minimize the squeeze potential, casing should be provided. Due to high squeeze potential, the following note should appear on the final plans:

'Due to the squeeze potential of the clay soils, the use of temporary casing will be required to properly construct the shafts. Casing may be pulled or remain in place, as determined by the Contractor at no cost to the Department.'

The wall should be constructed as per IDOT Standard Specifications and the current special provisions developed by IDOT for construction of drilled soldier pile wall.

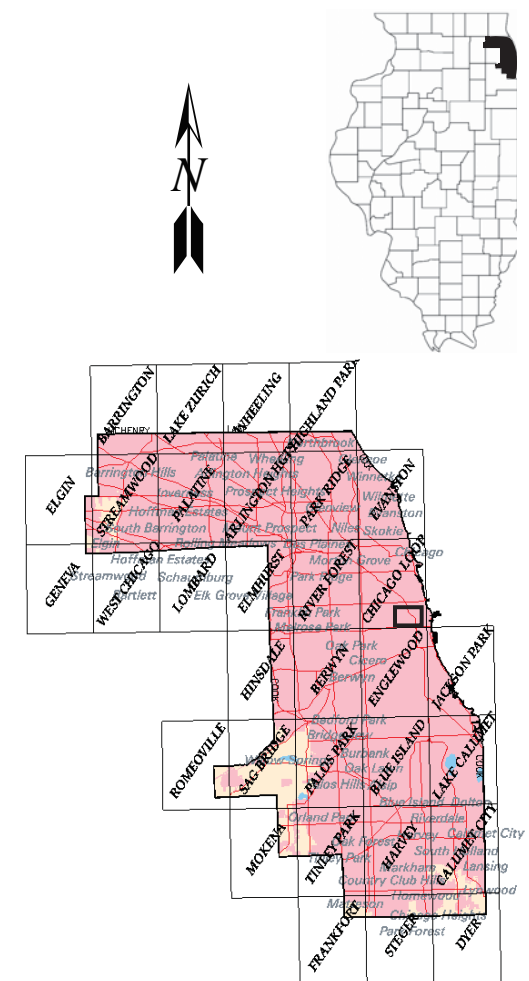

During shaft construction, the existing building and walls should be monitored for movement. Survey points should be established to monitor horizontal and vertical movements.

ONE-DIMENSIONAL CONSOLIDATION TEST
AASHTO T 216 / ASTM D 2435

Project: Circle Interchange
Client: AECOM
Soil Sample ID: Boring 32-ST-01, ST#5, 21' to 23'
Sample Description: Gray CLAY with trace gravel (CL)

Tested by: M. Snider
Prepared by: M. Snider
Test date: 11/12/2014
WEI: 1100-04-01

Initial sample height = 1.004 in
Initial sample mass = 163.12 g
Initial water content = 26.04%
Initial dry unit weight = 100.46 pcf
Initial void ratio = 0.727
Initial degree of saturation = 99.60%

Final sample mass = 154.51 g
Final dry sample mass = 129.42 g
Final water content = 19.39%
Final dry unit weight = 115.22 pcf
Final void ratio = 0.506
Final degree of saturation = 100.00%
Estimated specific gravity = 2.78

Ring diameter = 2.495 in
Ring mass = 109.98 g
Initial sample and ring mass = 273.10 g
Tare mass = 78.78 g
Final ring and sample mass = 264.82 g
Mass of wet sample and tare = 233.29 g
Mass of dry sample and tare = 208.20 g
Initial dial reading = 0.01000 in
Final dial reading = 0.13864 in
LL = n.a. %
PL = n.a. %
% Sand = n.a. %
% Silt = n.a. %
% Clay = n.a. %

In-Situ Vertical Effective Stress = 1800 psf

Compression and Swelling Indices

APPENDIX D

Bench Mark: Set "X" on northwest corner of handhole along east edge of SB I-90/94 20 feet north of Madison Street. Elev. 596.13.

Existing Structure: None

Traffic on NB Washington Exit Ramp will be detoured during construction.

No Salvage.

Notes:

- 1.) Wall offsets are measured from the C of NB Washington Exit Ramp to the front face of cast-in-place fascia panels.
- 2.) C denotes construction joint.
- 3.) E denotes expansion joint.
- 4.) F.F. denotes Front Face.
- 5.) B.F. denotes Back Face.
- 6.) Soldier pile section, shaft diameter, spacing, and tip elevation to be determined during final design.
- 6.) Proposed drainage information shown is conceptual and will be determined during final design.

HIGHWAY CLASSIFICATION

NB Washington Exit Ramp
 Functional Class: Interstate
 ADT: 3,500 (2012); 4,000 (2040)
 ADTT: 0 (2012); 0 (2040)
 DHV: 430 (2040)
 Design Speed: 30 m.p.h.
 Posted Speed: 30 m.p.h.
 One-Way Traffic
 Directional Distribution: 100%

DESIGN SPECIFICATIONS

2017 AASHTO LRFD Bridge Design Specifications 8th Edition

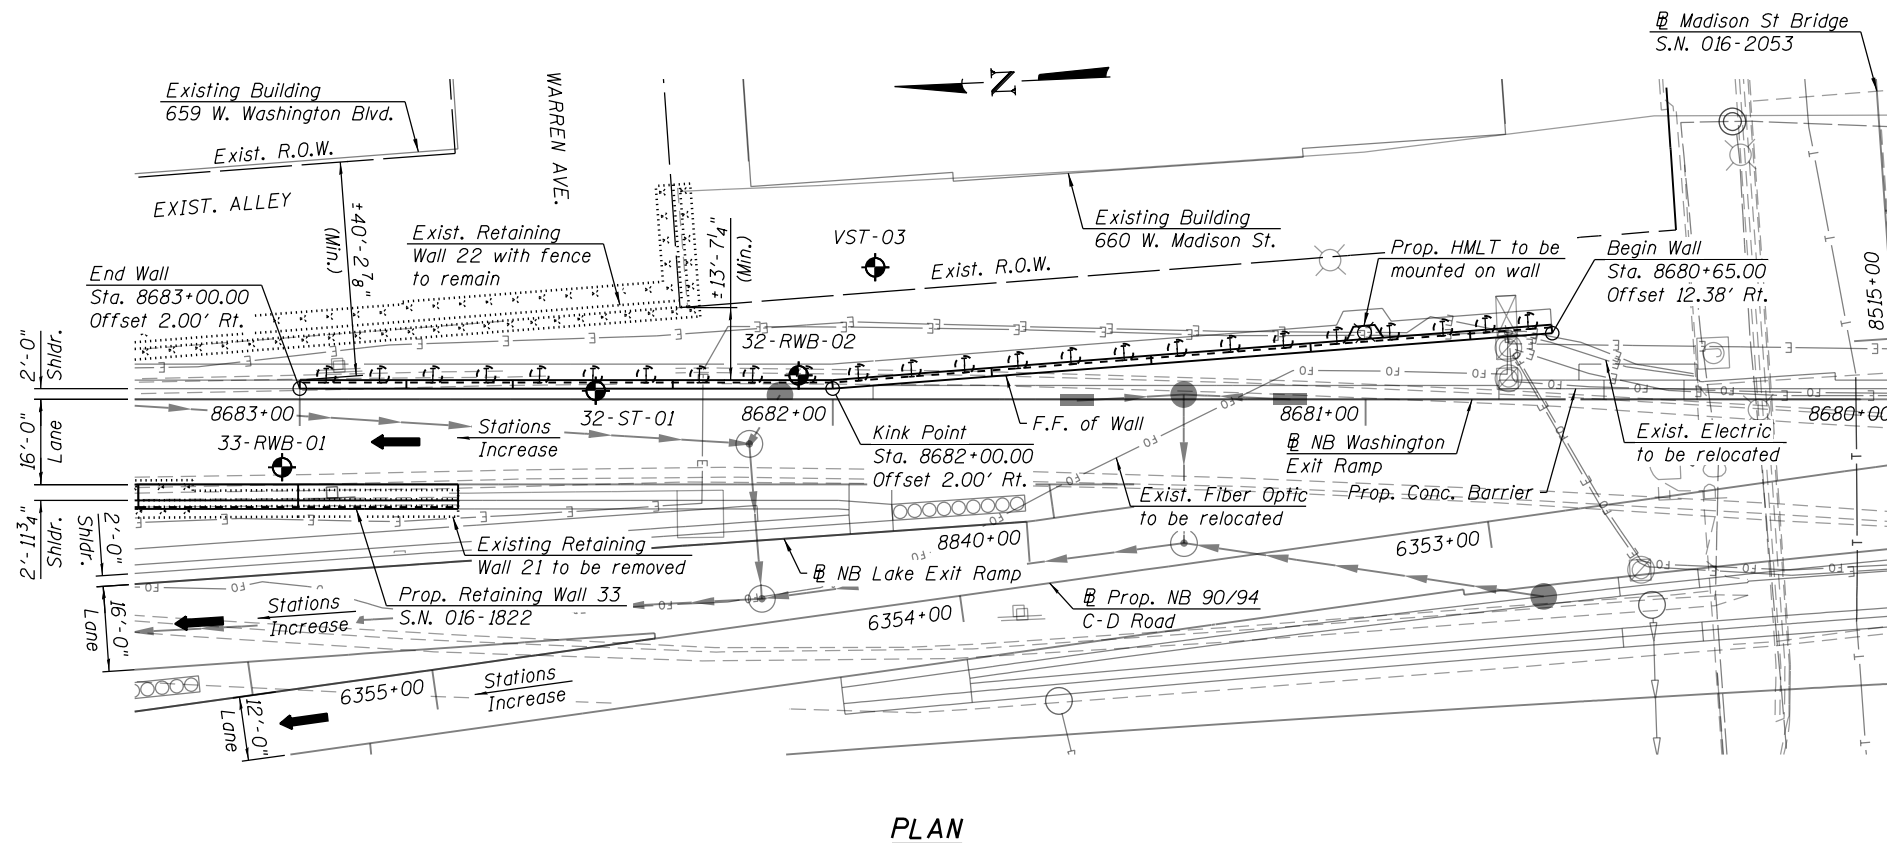

DESIGN STRESSES

FIELD UNITS

$f'_c = 3,500$ psi
 $f_y = 60,000$ psi (Reinforcement)

SOLDIER PILES

$f_y = 50,000$ psi (AASHTO M270 Gr. 50)
