NARRATIVE

A. PROJECT DESCRIPTION

This project consists of the reconstruction of IL RT. 47, and the IL 47/Main Street intersection, in unincorporated Kane County, Illinois. The roadway reconstruction consists of the addition of turning lanes and traffic signalization. Interchange reconstruction will extend into the Main Street right of way, owned by Kane County.

IL Rt. 47 crosses Blackberry Creek just north of its intersection with Main Street via an existing 4 barrel culvert (Structure Number 045-2000). The preliminary design of the IL Rt. 47 roadway improvements impact this culvert. The 4 barrel culvert is undersized and would allow stormwater to encroach on the roadway pavement during design storm events. Also the geometry of the 4 barrel structure is prone to collecting debris. This hydraulic report details the hydraulic design of the replacement drainage structure; a 54' span 3-sided Arch Culvert (Structure Number 045-2050). Also, an alternate proposed drainage structure has been analyzed in this report; a steel beam/concrete deck 76' single span, open abutment bridge.

Just south of the IL RT. 47 drainage structure is the Main Street Bridge over Blackberry Creek. The Main Street Bridge is within this reports study reach and it affects the hydraulics of Blackberry Creek. The Main Street Bridge is undersized and scour critical and Kane County is working on the design of a replaced bridge. This report details proposed hydraulic conditions for Blackberry Creek using both Main Street Bridge conditions, one hydraulic analysis with the existing bridge and one hydraulic analysis for the proposed bridge.

The various hydraulic studies have been assembled into groups, for identification purposes, summarized as follows:

- Group 1 - is considered as a design model that investigates the effects on Blackberry Creek by modifying only the IL Rt. 47 structure and uses recent surveyed data. This is the hydraulic analysis for the following conditions: proposed IL Rt. 47 drainage structure as a 3-sided Arch Culvert, with the existing Main Street Bridge. This analysis is identified as Group 1 (See Section 15.1.A for hydraulic analysis). An alternate hydraulic analysis was prepared for the following condition: proposed IL Rt. 47 drainage structure as a steel beam/concrete deck single span, open abutment bridge, with the existing Main Street Bridge (See Section 15.1.i for the alternate IL Rt. 47 Bridge hydraulic analysis).

- Group 2 - is the other design model that investigates the effect on Blackberry Creek by using the proposed Main St bridge in conjunction with the proposed IL Rt. 47 structure. This hydraulic analysis was prepared for the following conditions: proposed IL Rt. 47 drainage structure as a 54-foot 3-sided Arch Culvert, with the proposed Main Street Bridge. This analysis can be found in Section 15.2.A and Section 15.2.i (IL Rt. 47 Bridge option).

- Group 3 - is the modified effective FIS model and is considered to be the "permit" model. This hydraulic analysis is for the following conditions: existing and proposed IL Rt. 47 structure used in place

of the structure used in the effective FIS model. This analysis can be found in Section 15.3.A and Section 15.3.i.

- Group 4 - is the modified effective FIS model and is considered to be an additional “permit” model. This hydraulic analysis was prepared for the following conditions: proposed Main St structure with the revised existing/proposed IL Rt. 47 structure. This analysis can be found in Section 15.4.A and Section 15.4.i (Bridge option) for hydraulic analysis).

The following is a summary of the finding of this report.

- The existing IL Rt. 47 drainage structure is undersized and is proposed to be replaced with a 3-sided concrete arch culvert.
- The existing Main St. structure does influence the headwater on the IL Rt. 47 structure in proposed and existing conditions.
- The proposed Main St. structure reduces the impact to the proposed IL Rt. 47 structure.
- There is a sensitive flood receptor located at the north east corner of the intersection of IL Rt. 47 and Main Street, the Blackberry Inn. However, this sensitive receptor will be removed and will be used for compensatory storage.
- Compensatory storage is required for roadway flood fill.

B. DESCRIPTION OF EXISTING STRUCTURE AND FLOODPLAIN

The existing IL Rt. 47 drainage structure is a 4 barrel reinforced concrete culvert, with wing walls installed at each face. There are two different barrel dimensions within the structure, the outer barrel dimensions are 6.5' H x 8.75' W, the inner barrel dimensions are 6.5' H x 10.42' W (See Section 12, Bridge Layout/Plan Drawing Plots for details). The IL Rt. 47 culvert accumulates debris on its upstream face and silt is accumulating downstream of the culvert. There were no signs of scour and the culvert had approximately one foot of silt over the bottom of the pipes. The existing vegetative cover of Blackberry creek is as follows: tree cover for the floodway limits and grass/pavement cover for the floodplain. The existing structure does not meet the current IDOT requirement for freeboard.

The existing Main Street bridge is a single pier, 2 span, 40 foot wide concrete closed abutment bridge. The bridge span is 18 feet per span with a 2 foot wide pier and perpendicular concrete walls underneath the structure (See Section 12, Bridge Layout/Plan Drawing Plots for details). The existing vegetative cover for the Main Street Bridge is similar to the IL Rt. 47 Bridge.

C. FIELD OBSERVATIONS

The IL Rt. 47 culvert visually appears to impede the flood flows. Debris, including logs and trees were observed at the upstream face of the culvert. No signs of scour were present during the site visit. Also, silt is accumulating at the downstream face of the structure.

D. HISTORICAL OBSERVATIONS / RECORDS

During the survey of cross-sections used in the HEC-RAS model the surveyor noted that a property owner at 43 W 659 Main Street (409 feet east of the intersection of Route 47 and Main St, south side of Main St.) disclosed that the floodwaters had crested the roadway twice in the last 30 years. However, the owner could not remember the dates of those flooding occurrences. The owner of the Blackberry Inn Bar & Grill mentioned to the cross-section surveyor that during a flood of one particular year there was about one foot of water inside the restaurant. The owner, however, could not remember the date of the event. The low entry elevation of the restaurant is at 730.12 feet; with an inside water depth of 1 foot (731.12 feet) the flood frequency must have been higher than the FIS 500-yr elevation of approximately 730.4 feet. The all-time water elevation used in this report will be 731.12 feet.

USGS records indicate that the all-time high water elevation at the structure was 728.20 in the October 1954 flood.

According to an IDOT Operations and Communications Center incident report number 94-2606 recorded in 1994, Route 47 was impassable due to flooding. In the memo (by Bureau of Programming) that included the incident report it was mentioned that the area has flooded numerous times rendering Route 47 impassable by roadway vehicles. (See Section 22, Correspondence Notes for details)

Kane County has also notified IDOT that flood waters overtopped the roadway during an extreme storm event in 1996.

E. OTHER STUDIES AND AFFECTED AGENCIES

The Federal Emergency Management Agency (FEMA) has prepared a Flood Insurance Study (FIS) for Blackberry Creek. The HEC-RAS analysis contained in this report used the following information from the FIS study:

- Hydrologic data
- Starting water surface elevations
- Boundary conditions.

Cross sectional data was obtained from survey data preformed as part of this report. The location of the surveyed cross sections were correlated with the FIS cross section location, to calibrate this reports hydraulic models with the hydraulic models prepared for the FIS report (the FIS study was used as a reference/comparative tool for this report).

Kane County will also be affected by this project's roadway improvements.

F. DATUM CORRELATION

The FIS study used as a basis for this study was correlated to the state's vertical datum.

Cross -Sections and streambed profiles, along with culvert cross sections, and roadway cross sections and profiles, were obtained by a topographic survey performed for this report.

The elevations used throughout this report, and in waterway information tables (WIT), corresponds to the projects vertical datum.

Survey controls in the watershed were established by the Illinois Department of Natural Resources-Office of Water Resources (IDNR-OWR) and benchmark points were established by Smith Engineering Consultants, Inc., using the differential (also known as real-time kinematic (RTK)) global positioning system technique (Bill Rice, Illinois Department of Natural Resources-Office of Water Resources, written commun., 2001). The benchmark network was referenced to present (2000-01) Kane County and Illinois Department of Transportation (IDOT) first-order control stations along with U.S. Geological Survey (USGS) benchmarks. The Kane County and IDOT stations were held in the adjustment using NAVD88 altitudes. The USGS benchmarks originally were established on NGVD29 and benchmark elevations were converted to NAVD88 using the CORPSCON program. The final survey control was based upon NAVD88 and checked within 0.1 foot with the available USGS benchmark NAVD88 values.

ROUTE 47

G. SENSITIVE FLOOD RECEPTOR

Currently there is one sensitive flood receptor, upstream of the Route 47 culvert, the Blackberry Inn Bar & Grill Restaurant (See Section 7, Photographs).

This structure was noted as being flooded on at least one occasion. The building's low entry elevation is 730.12 feet (100-year base flood elevation, BFE, is 729.10 feet).

It should be noted that this structure will be removed as part of this project and the property will be used for Compensatory Storage. With the removal of this structure the requirement for keeping the increase in floodwaters under 0.10 feet is no longer applicable.

H. HYDROLOGIC METHODOLOGY

No hydrologic study was performed for this project. Hydrologic data was obtained from the existing FIS study of Blackberry Creek.

I. HYDRAULIC METHODOLOGY

Hydraulic Engineering Center – River Analysis System (HEC-RAS) software was used to prepare the hydraulic analysis (the FIS study also used HEC-RAS software).

Blackberry Creek Cross sections weNŜ surveyed as part of this report.

N values were obtained from the FIS study, checked and modified, as required, to fit the surveyed cross sections.

Starting water surface elevations were obtained from the FIS study.

See Section 15 for detailed hydraulic analysis for all Groups.

J. SUMMARY OF NATURAL AND EXISTING HYDRAULIC ANALYSIS

Blackberry Creek in this reach appears to have not been altered by earthworks or channelization. Therefore, to approximate the natural conditions in the hydraulic analysis the natural condition model was prepared by removing the existing IL Rt. 47 drainage structure along with its upstream and downstream cross section. N values for the natural conditions were checked and adjusted as necessary.

The elevation shown on the WIT's were obtained from the output data of the HEC-RAS reports for the 10 yr, 50 yr, 100 yr and 500 year flood frequencies. The natural, existing and proposed elevations were taken at the upstream end of the drainage structures (existing and proposed conditions).

Waterway openings were obtained by calculating the cross sectional areas in Microstation. The area calculated was between the natural water level and the existing channel at the upstream face of the existing and proposed drainage structures.

The approach section was created by using a contraction ratio of 1:1 to a point where contraction was determined to begin. A new cross section was created at this point by interpolating the surveyed cross sections.

Created Head Calculation was determined by subtracting the existing and proposed water surface elevations from the natural conditions water surface elevations for each storm frequency. The natural condition model referenced is where both IL 47 and Main St structures and bounding cross-sections were removed.

Freeboard criteria used was a minimum 3' clearance from the water surface elevation of the design frequency storm, 50 yr, and the edge of the proposed roadway pavement (low side of the superelevated roadway section) at the southern upstream floodplain limits located at Sta. 501+17.

Freeboard criteria resulted in raising the roadway several feet. The impacts of the raised roadway include floodplain/floodway fills and right of way impacts. The Blackberry Creek Inn Bar and Restaurant property would be rendered inaccessible as the proposed driveway would end too close to the existing building for proper vehicle maneuvering.

The existing culvert impacts the natural conditions by raising the water surfaces elevation as follows:

- 10 yr. flood frequency has a created head of 0.07'
- 50 yr. flood frequency has a created head of 0.38'
- 100 yr. flood frequency has a created head of 0.32'
- 500 yr. flood frequency has a created head of 0.00' (overtopping IL-47)

HEC-RAS software Errors and Warnings were addressed during the development of the hydraulic analysis. Adjustments were made in the HEC-RAS models to eliminate the significant warnings messages.

K. PROPOSED STRUCTURE ANALYSIS

The location of the proposed structure is on the same center line as the existing structure. The proposed IL Rt. Route 47 drainage structure is a 3-sided Concrete Arch Culvert. The culvert span is proposed to be 54 feet with a 13 foot rise and the length will be 70 feet wide (headwall to headwall). The wingwall and abutment areas at the upstream face of the Arch Culvert will be armored with rip-rap as scour countermeasures (See Section 14, Culvert Section Plots-Proposed Conditions).

An alternate proposed structure was analyzed consisting of a 76 foot span, 66' long steel beam bridge for Phase II design and cost flexibility. The existing conditions upstream and downstream cross sections were adjusted for the proposed conditions. The shapes of these cross-sections were modified to detail the proposed structures geometry (76' clear opening with 2:1 side slopes). The low chord elevation is set at 730.1 feet, over 2' above the base flood elevation for the design storm (50 yr. flood frequency) in the Group 3 hydraulic analysis.

L. SCOUR ANALYSIS

A scour analysis was performed for the 54' x 13' 3-sided arch culvert. HEC-RAS software was used to develop abutment scour depth and manual HEC-18 calculations were used to calculate contraction scour depths (See Section 16, Scour Analysis, for details). The data used in the model is based on USGS soil data and field observations.

A summary of the scour analysis is as follows:

- Significant scour will occur for the Arch Culvert during 100 yr (18.79 ft) and the 500 yr (22 .74 ft).
- Soil Borings from 1976 for the Main street bridge were available and reveal that the soil strata varies from sand – gravel – silty clay – gravel. In one boring hole evidence of flowing sand was found at an elevation of approximately 714.8. Based on this initial information it appears that piers will be needed for any structure planned for this location.
- Given the potentially unstable strata of soil and possibly high scour depths it would be recommended to install piers/spread footing combination deep enough to minimize scour hazard. Once soil borings information is obtained in Phase 2, more precise scour depths can be calculated and foundation/pier designs can be completed.
- Wing walls will be incorporated into the design to allow for more efficient routing of floodwaters through the structure.
- Scour rip-rap design for the culvert will also be determined during Phase II work for the open abutment and low flow channel areas.
- The proposed bridge alternate requires rip-rap scour protection for the slopewalls.

M. COMPENSATORY STORAGE

Compensatory storage is required for this project and requires ROW acquisition. The IDOT criteria of 1:1 will be used for replacement of floodway storage. The location of the compensatory storage is proposed to be located on the current Blackberry Creek Inn site.

The locations of the proposed compensatory storage area, along with the supporting calculations are contained in Section 19, Compensatory Storage.

The required compensatory storage is 0 cubic yards of fill in the floodway for the 0-10 year flood frequency (Floodway excavation exceeds Floodway fill) and 759 cubic-yards of fill in the floodway for the 10-100 year flood frequency. The proposed compensatory storage provided is 1172 cubic-yards for the 0-10 year flood frequency and 2120 cubic-yards for the 10-100 year frequency. The compensatory storage provides storage for both floodway and floodplain fills. The compensatory storage will be situated on the current Blackberry Creek Inn property and is hydraulically connected to Blackberry Creek.

N. PERMIT REQUIREMENTS

A floodway permit will be necessary since replacement of the culvert with a 3-sided Arch Culvert is not considered maintenance under the IDNR/OWR Part 3708 rules (See Section 18 - Permit Summary Form). The project scope requires a new profile increase to meet freeboard requirements. The proposed 3-sided Arch Culvert is an appropriate use of the regulated floodway as it does not result in an increase of upstream flood stages by more than 0.1 foot when compared to the existing conditions for all flood events up to and including the 100-year frequency events. The current upstream structure, which has been damaged in the past, is being acquired due to geometry issues related to the profile increase that prevent access to the property from occurring. The structure (Blackberry Creek Inn Bar & Grill) on the property will be removed and the property will be utilized for compensatory storage for fill placed in the floodway.

The project also meets Part 3708 rules for appropriate uses and provides compensatory floodway storage that is available between the normal water elevation and the proposed 100-year flood elevation. All storage lost above the existing 10-year flood elevation is replaced above the proposed 10-year flood elevation.

The regulatory floodway velocities will also be kept at or lowered from existing conditions with the wider span of the proposed Arch Culvert.

O. FREEBOARD

The design of the proposed IL Rt. 47 3-sided Arch Culvert meets the requirements for freeboard, specifically:

- Freeboard criteria used was a minimum, 3’ clearance from the water surface elevation of the design frequency storm, 50 yr, and the edge of the proposed roadway pavement (low side of the super-elevated roadway section).

P. CONCLUSION

The conclusions of the reports are summarized as follows:

- The existing IL Rt. 47 drainage structure is undersized and is proposed to be replaced with a 3-sided concrete arch culvert.
- There is a sensitive flood receptor located at the north east corner of the intersection of IL Rt. 47 and Main Street, the Blackberry Inn. This sensitive flood receptor is proposed to be acquired and the subsequent property will be used as compensatory storage.
- Rip-Rap and foundation piles may be required for scour countermeasures.
- Compensatory storage is required for roadway floodplain fill.
- Water surface elevations in the proposed conditions will be lower than existing conditions.

Section 4: WATERWAY INFORMATION TABLE (WIT) SCENARIO TABLE

WIT	Scenario
Group #1 WIT Arch (Exhibit 1-03.2a)	• Existing Main Street bridge geometry used in all models (Natural, Existing, and Proposed) • Natural Condition uses Existing Main Street bridge and removes the Route 47 Structure • Existing Condition models the existing Route 47 Culvert • Proposed Condition models the Route 47 3-Sided Arch Culvert • Cross-Sections and stream geometry surveyed by Globetrotters Engineering

Surveyed Normal Water Level: 719.83 ft

10 YEAR VELOCITY THROUGH EXISTING STRUCTURE = 3.12 ft/s

10 YEAR VELOCITY THROUGH PROPOSED ARCH = 1.9 ft/s

2-Yr. Flow Rate = 265 ft^3/s

EXISTING STRUCTURE

TYPE: RC Box Culvert

LENGTH/WIDTH: (2) 6.5' x 8.75' & (2) 6.5'x10.42'

 # SPANS/CELLS: 4

SKEW : 0 (relative to road)

LOW EOP: 728.59 @ 501+17 20' RT

FREEBOARD: 0.11 ft

CULVERT INV. 718.38 (U/S) 718.25 (D/S)

PROPOSED STRUCTURE

TYPE: Open abutment with steel superstructure

LENGTH OF SPAN: 76 ft

 # SPANS: 1

LOW CHORD: 730.10

SKEW : 0 (relative to road)

CLEARANCE: 2.06 ft

BRIDGE FLOW LINE: 718.7 (U/S) 718.62 (D/S)

LOW EOP: 734.1 @501+17 22' RT

FREEBOARD: 4.18 ft

NOTES:

Proposed structure details are preliminary. Subject to refinement in TS&L stage.
Waterway openings are based on the natural H.W.E.
Natural HWE taken from cross-section 139653 in Group #1 Natural Conditions model.
The existing head is the difference in water surface elevations between existing and natural conditions.
The proposed head is the difference in water surface elevations between proposed and natural conditions
The freeboard is calculated from the edge of the proposed shoulder at 501+17
Existing Proposed Discharge Rates are based on USGS model used to develop the FIS profiles.
~ Waterway opening includes overtopping area (measured in Microstation) + Existing Culvert Area

Group #1 - Bridge

PROPOSED STRUCTURE

3-SIDED CULVERT TYPE: Pre-Cast Concrete Arch

LENGTH OF SPAN: 54'

 # CELLS: 1

TOP OF CROWN ELEVATION: 731.36

SKEW : 0 (relative to road)

FLOWLINE ELEV: 718.63 (u/s) 718.52 (d/s)

LOW EOP: 733.52 @ 501+17 60' RT

FREEBOARD: 5.41 ft

NOTES:

Proposed structure details are preliminary. Subject to refinement in TS&L stage.
Waterway openings are based on the natural H.W.E.
Natural HWE taken from cross-section 139757 in Group #2 Natural Conditions model.
The existing head is the difference in water surface elevations between existing and natural conditions.
The proposed head is the difference in water surface elevations between proposed and natural conditions
Existing Proposed Discharge Rates are based on USGS model used to develop the FIS profiles.
Due to three sided structure design, 2 feet of the vertical wall portion will be embedded to provide protection from scour.
~ Waterway opening includes overtopping area (measured in Microstation) + Existing Culvert Area

BACK-UP CALCULATIONS FOR WIT: Group #3 (continued)

CALCULATE FREEBOARD AND CLEARANCE

LOW ROAD ELEVATION (ft)			
Existing	**Station**	**Proposed**	**Station**
728.59	501+17	733.56	501+17
LOW BEAM ELEVATION (ft)			
Existing	**Station**	**Proposed**	**Station**
N/A	N/A	N/A	N/A
PROPOSED FREEBOARD (ft)			
10-Yr	**50-Yr**	**100-Yr**	**500-Yr**
6.89	5.38	4.70	2.54
PROPOSED CLEARANCE (ft)			
10-Yr	**50-Yr**	**100-Yr**	**500-Yr**
N/A	N/A	N/A	N/A

CALCULATE EFFECTIVE WATER OPENING AREA FOR CULVERT

STRUCTURE SIZE (ft x ft)			
EXISTING WIDTH	**EXISTING HEIGHT**	**PROPOSED WIDTH**	**PROPOSED HEIGHT**
38.3	6.5	54	13
STRUCTURE INVERT ELEVATION (ft)			
EXISTING		**PROPOSED**	
U/S	D/S	U/S	D/S
718.38	718.25	717.27	717.07

WATERWAY OPENING AREA (ft^2)		
Frequency	**EXISTING**	**PROPOSED**
10-YR	203.20	325.10
50-YR	203.20	379.80
100-YR	203.20	399.80
500-YR	1053.40	430.80

500-YR Existing Waterway Opening is the culvert area plus the overtopping area at the edge of existing pavement - area measured in Microstation

500-YR proposed Waterway Opening is above proposed concrete arch, and may result in pressure flow, no overtopping of pavement is expected.

CULVERT INV. 718.38 (U/S) 718.25 (D/S)

PROPOSED STRUCTURE

TYPE: Open abutment with steel superstructure

LENGTH OF SPAN: 76 ft

 # SPANS: 1

LOW CHORD: 730.10

SKEW : 0 (relative to road)

CLEARANCE: 2.10 ft

BRIDGE FLOW LINE: 718.7 (U/S) 718.62 (D/S)

LOW EOP: 734.1 @501+17 22' RT

FREEBOARD: 6.02 ft

NOTE: Proposed structure details are preliminary. Subject to refinement in TS&L stage.
Waterway openings are based on the natural H.W.E.
Natural HWE taken from cross-section 139750 in Group #3 Natural Conditions model.
The existing head is the difference in water surface elevations between existing and natural conditions.
The proposed head is the difference in water surface elevations between proposed and natural conditions
The freeboard is calculated from the edge of the proposed shoulder at 501+17
Existing Proposed Discharge Rates are based on USGS model used to develop the FIS profiles.
~ Waterway opening includes overtopping area (measured in Microstation) + Existing Culvert Area

CALCULATE EFFECTIVE WATER OPENING AREA FOR CULVERT

STRUCTURE SIZE (ft x ft)			
EXISTING WIDTH	**EXISTING HEIGHT**	**PROPOSED WIDTH**	**PROPOSED HEIGHT**
38.3	6.5	N/A	N/A
STRUCTURE INVERT ELEVATION (ft)			
EXISTING		**PROPOSED**	
U/S	D/S	U/S	D/S
718.38	718.25		

WATERWAY OPENING AREA (ft^2)		
Frequency	**EXISTING**	**PROPOSED**
10-YR	203.20	349.90
50-YR	203.20	452.90
100-YR	203.20	498.20
500-YR	1053.40	619.40

500-YR Existing Waterway Opening is the culvert area plus the overtopping area at the edge of existing pavement - area measured in Microstation

500-YR proposed Waterway Opening is contained within the proposed Bridge, no overtopping of pavement is expected - area measured in Microstation

10 YEAR VELOCITY THROUGH EXISTING STRUCTURE = 3.12 ft/s

10 YEAR VELOCITY THROUGH PROPOSED ARCH = 1.92 ft/s

2-Yr. Flow Rate = 265 ft^3/s

EXISTING STRUCTURE

TYPE: RC Box Culvert
LENGTH/WIDTH: (2) 6.5' x 8.75' & (2) 6.5'x10.42'
 # SPANS/CELLS: 4
SKEW : 0 (relative to road)
LOW EOP: 728.59 @ 501+17 20' RT
FREEBOARD: 0.11 ft
CULVERT INV. 718.38 (U/S) 718.25 (D/S)

PROPOSED STRUCTURE

3-SIDED CULVERT TYPE: Pre-Cast Concrete Arch
LENGTH OF SPAN: 54 ft
 # CELLS: 1
TOP OF CROWN ELEVATION: 731.36
SKEW : 0 (relative to road)
FLOWLINE ELEV: 718.63 (u/s) 718.52 (d/s)
LOW EOP: 733.52 @ 501+17 60' RT
FREEBOARD: 5.62 ft

NOTE: Proposed structure details are preliminary. Subject to refinement in TS&L stage.
Waterway openings are based on the natural H.W.E.
Natural HWE taken from cross-section 139750 in Group #4 Natural Conditions model.
The existing head is the difference in water surface elevations between existing and natural conditions.
The proposed head is the difference in water surface elevations between proposed and natural conditions
The freeboard is calculated from the edge of the proposed shoulder at 500+17
Existing Proposed Discharge Rates are based on USGS model used to develop the FIS profiles.
~ Waterway opening includes overtopping area (measured in Microstation) + Existing Culvert Area

ALL - TIME H.W.E. & DATE: 731.12 ft, inside Blackberry Inn, July 16-18, 1996

Surveyed Normal Water Level: 719.83 ft

10 YEAR VELOCITY THROUGH EXISTING STRUCTURE = 3.12 ft/s

10 YEAR VELOCITY THROUGH PROPOSED ARCH = 1.80 ft/s

2-Yr. Flow Rate = 265 ft^3/s

EXISTING STRUCTURE

TYPE: RC Box Culvert

LENGTH/WIDTH: (2) 6.5' x 8.75' & (2) 6.5'x10.42'

 # SPANS/CELLS: 4

SKEW : 0 (relative to road)

LOW EOP: 728.59 @ 501+17 20' RT

FREEBOARD: 0.11 ft

CULVERT INV. 718.38 (U/S) 718.25 (D/S)

PROPOSED STRUCTURE

TYPE: Open abutment with steel superstructure

LENGTH OF SPAN: 76 ft

 # SPANS: 1

LOW CHORD: 730.10

SKEW : 0 (relative to road)

CLEARANCE: 2.31 ft

BRIDGE FLOW LINE: 718.7 (U/S) 718.62 (D/S)

LOW EOP: 734.1 @501+17 22' RT

FREEBOARD: 6.21 ft

NOTE: Proposed structure details are preliminary. Subject to refinement in TS&L stage.
Waterway openings are based on the natural H.W.E.
Natural HWE taken from cross-section 139750 in Group #4 Natural Conditions model.
The existing head is the difference in water surface elevations between existing and natural conditions.
The proposed head is the difference in water surface elevations between proposed and natural conditions
The freeboard is calculated from the edge of the proposed shoulder at 501+17
Existing Proposed Discharge Rates are based on USGS model used to develop the FIS profiles.
~ Waterway opening includes overtopping area (measured in Microstation) + Existing Culvert Area

BACKUP CALCULATIONS: Group #4 WIT

Hydraulic Report Data Sheets

Route	IL Route 47 and Main Street	P or D #	P-91-449-09
Section		PTB #	152
County	Kane		
Exist SN	045-2000		
Prop SN	045-2050		

General Information

1. Name of the Stream: Blackberry Creek

2. Location of the Structure: SE ¼ of the ¼ of Section 20, Township 39N, Range 7E of the 3rd P.M.

3. Hydraulic Report Prepared By: ☒ Consultant Globetrotter's Engineering Corporation
   ☐ District

4. Hydraulic Report Approval Authority: ☐ District – Post PDF of HR to BBS Hydraulics SharePoint Server
   ☒ BBS Hydraulics - Submit 2 hard copies of HR to BBS Hydraulics

Site Design Data

5. Drainage Area (sq. mi.): 11.3

6. Highway Classification:
   ☒ Rural ☐ Urban ☐ Other
   ☒ Principal Arterial ☐ Minor Arterial ☐ Collector ☐ Local

7. Design Frequency: ☐ 30 yr ☒ 50 Yr. ☐ Other

8. Number of Waterway Information Tables (WIT): 8
   If more than one, explain: Two Design WIT and one Permit (FIS) WIT were developed, due to the downstream Main Street Structure replacement/modeling.

Hydrologic & Hydraulic Analysis

9. Hydrology Modeling (check all that apply): ☐ USGS/Stream Stats ☒ FIS ☐ Gage Data
   ☐ Other

10. Hydraulic Modeling (check all that apply):
    a. Method: ☒ HEC-RAS ☐ WSPRO ☐ Other
    b. Manning's "n" values determined as per IDOT DM CH.5? ☒ Yes ☐ No
       If no, explain:
    c. Source of Starting WSE: FIS
    d. Non- IDOT encroachments in Survey? ☒ Yes ☐ No
       If yes, are they accounted for? ☒ Yes ☐ No
    e. Does the Tailwater Control? ☒ Yes ☐ No
       If yes, list:
    f. Were the Expansion/Contraction cones properly addressed? ☒ Yes ☐ No ☐ N/A
       If No or N/A, explain:

g. What Expansion and Contraction Rates were used? Expansion: .3 (X:1)
Contraction .5 (X:1)

IDNR – OWR Floodway Permit

11. Is area experiencing urbanization or expected to urbanize within 10 years? ☒ Yes ☐ No

12. Are there any sensitive flood receptors located upstream within possible backwater influence? ☒ Yes ☐ No
If yes, list and describe critical upstream flood damageable properties and their elevations.
1) (To Be Removed) 82' S of IL47 structure, Low Opening 730.12 feet, Blackberry Creek Inn Bar and Grill.
2) (To Be Removed) Outside of the 500-yr floodplain, listed due to proximity to floodplain, Low Opening 734.3 feet.

13. Is there any History of Flooding or Overtopping problems? ☒ Yes ☐ No
Sources of Observed Highwater:
Blackberry Inn observed 1 foot depth in restaurant (731.12 feet) during the major 1996 event. Road was overtopped.

14. Is the structure hydraulically connected to or within the floodway of an IDNR-OWR designated Public Body of Water? ☐ Yes ☒ No

15. Required IDNR - OWR Permit type:
☐ Individual ☐ SWP #2 ☐ SWP #12 ☒ Floodway
☐ None ☐ Other

Proposed Structure Data

16. Project Scope (check all that apply):
a. ☒ Complete Replacement
b. ☐ Superstructure Replacement
c: ☐ Superstructure Widening; Length of Pier Extension in the water:
U/S D/S
d. ☐ Bridge ☒ Culvert
e. ☐ New Alignment
f. Work Planned Below Q_{100} HWE? ☒ Yes ☐ No
g. ☒ Profile Raise

17. If a bridge is proposed, supply:
Flow line elevation (ft): Abutment type:
Preliminary low beam elevation (ft): Skew (degrees):
Width of deck (ft): Number of spans:
Total length from face to face of abutment (ft)

18. If a culvert is proposed, supply:
Type and size: Length (ft):
Upstream invert elevation (ft): Entrance type:
Downstream invert elevation (ft): Skew (degrees):
Note: Upstream and downstream elevations should reflect the elevations before the 3" drop is applied

19. If a three-sided structure is proposed, supply:
Flow line elevation (ft): 717.2 Skew (degrees): 0
Span (ft): 54 Length (ft): 70
Height (ft): 13 Number of spans: 1

20. a. Is the IDOT Clearance Policy Met? ☐ Yes ☐ No ☒ NA Value (ft):
b. Is the IDOT Freeboard Policy Met? ☒ Yes ☐ No ☐ NA Value (ft): 4.69

21. Type of streambed soil : ☐ Clay ☐ Silt ☐ Sand ☒ Loam ☒ Muck

22. Scour/ Migration Problems: ☒ None/Minimal ☐ Significant ☐ Severe
Comments: Site inspection reveals some scour around locations where debris has collected.

Ice Concerns: ☒ None/Minimal ☐ Significant ☐ Severe
Comments:

Debris Concerns: ☐ None/Minimal ☒ Significant ☐ Severe
Comments: fallen timbers and other collected debris are present at the upstream face of the existing culvert.

Countermeasures Proposed: Remove all debris and accumulated silt

Existing Structure Data

		Structure U/S	Subject Structure	Structure D/S
23.	Distance from proposed structure: (ft.)	5012'	0'	283'
24.	Type of structure:	Bridge	Culvert	Bridge
25.	Low beam elevation:	734.85	718.38 (inv)	726.67
26.	Flow line elevation:	727.15	719.02	718.96
27.	Maximum known high water elevation:	736.1	731.12	727.6
28.	Date of maximum high water:	July 1996	July 1996	July 1996
29.	Cause (backwater, headwater, etc.):	Backwater	Headwater	Backwater
30.	Does structure carry entire design flood flow?	☒ Yes ☐ No	☐ Yes ☒ No	☐ Yes ☒ No
	If not, state area of additional waterway opening: (ft^2)		584	133
31.	Type and size of existing overflow structures:		Roadway overflow	Roadway overflow
32.	Has adverse scour occurred under or adjacent to the structure?		no	yes
33.	Classify type of scour and/or aggradation / degradation:		aggradation at D/S and U/S	severe scour at U/S face

Required Additional Data

34. Deviations from the General Procedures presented in IDOT DM CH. 2, CH.6, and CH.7:

35. Information regarding high water from other streams, reservoirs, flood control projects, proposed channel changes, or other controls affecting proposed waterway area:

36. Site Inspection made by: Stephen Schuh Date: 9-07-2010

Remarks:

37. Prepared by: Stephen Schuh Date 7/28/2014

Signed (QA/QC): DAVID HANDWERK Date 7/30/2014

Hydraulic Report Checklist

The District or Consultant should complete the following checklist before submitting the Hydraulic Report for approval.

1. ☒ Title Page
2. ☒ Table of Contents
3. ☒ Narrative - (as outlined in Section 2-601.01 Item #3)
4. ☒ Waterway Information Table (WIT) - (as outlined in Section 2-601.01 Item #4)
5. ☒ Hydraulic Report Data Sheets
6. ☒ Location Map - should show the subject structure along with nearby location defining landmarks (cities, roads, highways, etc.)
7. ☒ USGS Hydraulic Investigation Map (District 1 only)
8. ☒ Photographs - (Minimum: U/S & D/S Structure Faces, Up & Down Channel, Up & Down Roadway Across Structure)
9. ☒ Hydrology (map and calculations)
10. ☒ Streambed Profile
11. ☒ Roadway Profile (existing and proposed)
12. ☒ Cross Section Plots - with plan layout preferably overlayed upon an aerial photo with the contours
13. ☒ Bridge Opening Plots
14. ☒ Natural Condition Analysis
15. ☒ Existing Condition Analysis
16. ☒ Proposed Condition Analysis

When HEC-RAS modeling is being used, ALL Plans (Natural, Existing, & Proposed) shall be included in ONE Project File.

17. ☒ Scour Analysis – Existing and Proposed Conditions
18. ☒ Compensatory Storage Calculations (if required)
19. ☒ Survey Notes (if available, No Electronic Point Files)
20. ☒ Correspondence Notes
21. ☒ CD with Project Files (Include pdf copy of the Hydraulic Report)

GENERAL NOTES

Class X Concrete shall be used throughout.
Exposed edges shall be beveled ¾".
For backfilling and embankment see Std. Spec's.
All bars shall be lapped 20 diameters unless otherwise specified.
The top of the culvert, the backs of the sidewalls above the lower construction joint and backs of the wings above the tops of the footings shall be waterproofed in accordance with Art. 51.21 of the Std. Spec's.
Nonmetallic water seal used in the wingwall joints shall extend from the top of the footing to within 6" of the top of the headwall.
Any excavation needed to construct the culvert will not be paid separately but will be included to Class "X" Concrete.

*Note: The posts for Steel Plate Beam Guard Rail on the top of the box culvert shall be installed accordance to the detail of "Post anchor at piers" in the Standard 2230-2. The length of posts shall be cut to conform with the requirement of the Standard. The extra work and materials to install the posts on top of the box culvert shall be considered incidental to Steel Plate Beam Guard Rail.

Note: The Contractor shall remove and store the existing handrail at the location designated by the Engineer. The handrail shall be picked up by State Maintenance Crew.

GENERAL NOTES

Class X Concrete shall be used throughout.
Exposed edges shall be beveled ¾".
For backfilling and embankment see Std. Spec's.
All bars shall be lapped 20 diameters unless otherwise specified.
The top of the culvert, the backs of the sidewalls above the lower construction joint and backs of the wings above the tops of the footings shall be waterproofed in accordance with Art. 51.21 of the Std. Spec's.
Nonmetallic water seal used in the wingwall joints shall extend from the top of the footing to within 6" of the top of the headwall.
Any excavation needed to construct the bridge shall not be paid separately but will be included to Class "X" Concrete.

Section 16 Scour Analysis Summary

Scour analysis indicates that for the 3-sided concrete arch culvert there will be significant abutment, contraction, and pressure scour for worst case scenarios, the 100 and 500-year events. The scour analysis for the bridge option at this time only includes calculations for abutment and contraction scour at this time. Scour analysis is not performed on the existing conditions as the structure exhibits no signs of scour in the field investigation. The below table records results from HEC-RAS output for abutment scour and manual HEC-18 Section 8.6.3 calculations contraction scour. Manual calculations for contraction scour were not done for the Bridge alternative.

Proposed 3-Sided Arch Conditions	Proposed Bridge Conditions
• 10-year storm event	• 10-year storm event
○ Contraction scour depth = 0.38 ft	○ Contraction scour depth = 0.00 ft
○ Left abutment scour depth = 3.71 ft	○ Left abutment scour depth = 0.10 ft
○ Right abutment scour depth = 7.94 ft	○ Right abutment scour depth = 6.36 ft
○ Total Scour = 8.32 ft (6.7*)	○ Total Scour = 6.36 ft
○ Potential scour elevation = 710.81 ft (712.23)	○ Potential scour elevation = 712.57 ft
• 50-year storm event	• 50-year storm event
○ Contraction scour depth = 0.96 ft	○ Contraction scour depth = 0.00 ft
○ Left abutment scour depth = 6.70 ft	○ Left abutment scour depth = 4.86 ft
○ Right abutment scour depth = 9.45 ft	○ Right abutment scour depth = 9.60 ft
○ Total Scour = 10.44 ft (11.3 ft*)	○ Total Scour = 9.60 ft
○ Potential scour elevation = 708.49 ft (707.63)	○ Potential scour elevation = 709.33 ft
• 100-year storm event	• 100-year storm event
○ Contraction scour depth = 1.24 ft	○ Contraction scour depth = 0.00 ft
○ Left abutment scour depth = 5.81 ft	○ Left abutment scour depth = 5.50 ft
○ Right abutment scour depth = 12.99 ft	○ Right abutment scour depth = 10.53 ft
○ Total Scour = 14.23 ft (15.0 ft*)	○ Total Scour = 10.53 ft
○ Potential scour elevation = 704.70 ft (703.93)	○ Potential scour elevation = 708.40 ft
• 500-year storm event	• 500-year storm event
○ Contraction scour depth = 0.00 ft	○ Contraction scour depth = 0.00 ft
○ Left Abutment scour depth = 8.14 ft	○ Left abutment scour depth = 8.51
○ Right Abutment scour depth = 15.54 ft	○ Right Abutment scour depth = 12.50 ft
○ Total Scour = 15.54 ft (20.5 ft*)	○ Total Scour = 12.50 ft
○ Potential scour elevation = 703.39 ft (698.43)	○ Potential scour elevation = 706.43 ft

(* - Total scour value from HEC-18 8.6.3 analysis, "Left" refers to south abutment, "Right" refers to north abutment.)

The potential scour is calculated from the channel lowpoint (718.93) located downstream of the structure (see Section 9 – Streambed Profile for the location of the lowpoint). Analysis indicates that the footing elevation of the 3-sided arch culvert will need to be set on a pedestal wall footing at an elevation lower than 703.93 feet, if using the more conservative value obtained with HEC-18 calculation for contraction scour. The abutment and contraction scour results should be investigated further in Phase 2 after soil boring information is available.

SCOUR EVALUATION

Re: Unincorporated Kane County (Elburn)
Section 107B-I-1
IL-47 over Blackberry Creek
(Main before D) Blackberry Creek

The proposed structure is an open spill-through abutment with a 3- sided arch culvert design that will replace the existing 4 barrel box culvert. The 3-sided arch culvert will have a 54 foot span, 13 foot rise and will be 70 feet long. The channel velocity through the proposed structure is calculated to be 2.5 fps for the 100-year event. Proposed countermeasures will be needed to protect the channel over banks at the expected velocity. HEC-RAS does not have a scour analysis for a culvert, therefore the (x,y) coordinates of the culvert shape were supplied by 3-sided arch culvert contractor and inserted to match up with the US and DS HEC-RAS stationing. The station and elevations of the culvert were used to define an US/DS low chord for a bridge deck that could be analyzed with HEC-RAS. HEC-18 analysis was used to calculate the contraction scour. The HEC-RAS plan name used for this scour analysis is Group#2-Proposed (GEC).p11 in the IL47 and Main Design Model.

Hydraulic Design Data 100-year

Results

Scour Depth Ys (ft):	0.94
Critical Velocity (ft/s):	0.50
Equation:	Live

HEC-18 Results for Scour : 5.8 ft

Note: Grain Size of 0.005 mm was initally assumed based on the NRCS Soil Survey indicating that the soil type was Lena Muck. Lena Muck properties have no measurements for percentage of particles passing the 4 in sieve or the #200 sieve, indicating that the soil particles are silt. An approximate diameter of silt(organic) particles is assumed to be 0.005 mm. However, a diameter size of 0.01 mm was used as a diameter of 0.005mm exaggerated scour amounts.

$$Y_{max} = \alpha_A * y_c \quad (8.3)$$

$$y_s = Y_{max} - y_0 \quad (8.4)$$

$$y_c = y_1 \left(\frac{q_{2c}}{q_1}\right)^{6/7} \quad (8.5)$$

Eqn. from HEC-18, Section 8.6.3

α_A From Figure 8.10 (HEC-18) found on graph using ratio q_{2c}/q_1

Y_{max} Maximum flow depth resulting from abutment scour

Y_c Flow depth including clear-water scour

y_s Abutment scour depth

y_0 Flow depth prior to scour

q_1 Upstream unit discharge, ft^2/s; = $Q_{(CHANNEL)} / T_w$

q_{2c} Unit discharge at U/S side of bridge output, ft^2/s, = (Q U/S) / E_w ; $E_w = A_{flow}/H_d$

y_1 Upstream flow depth

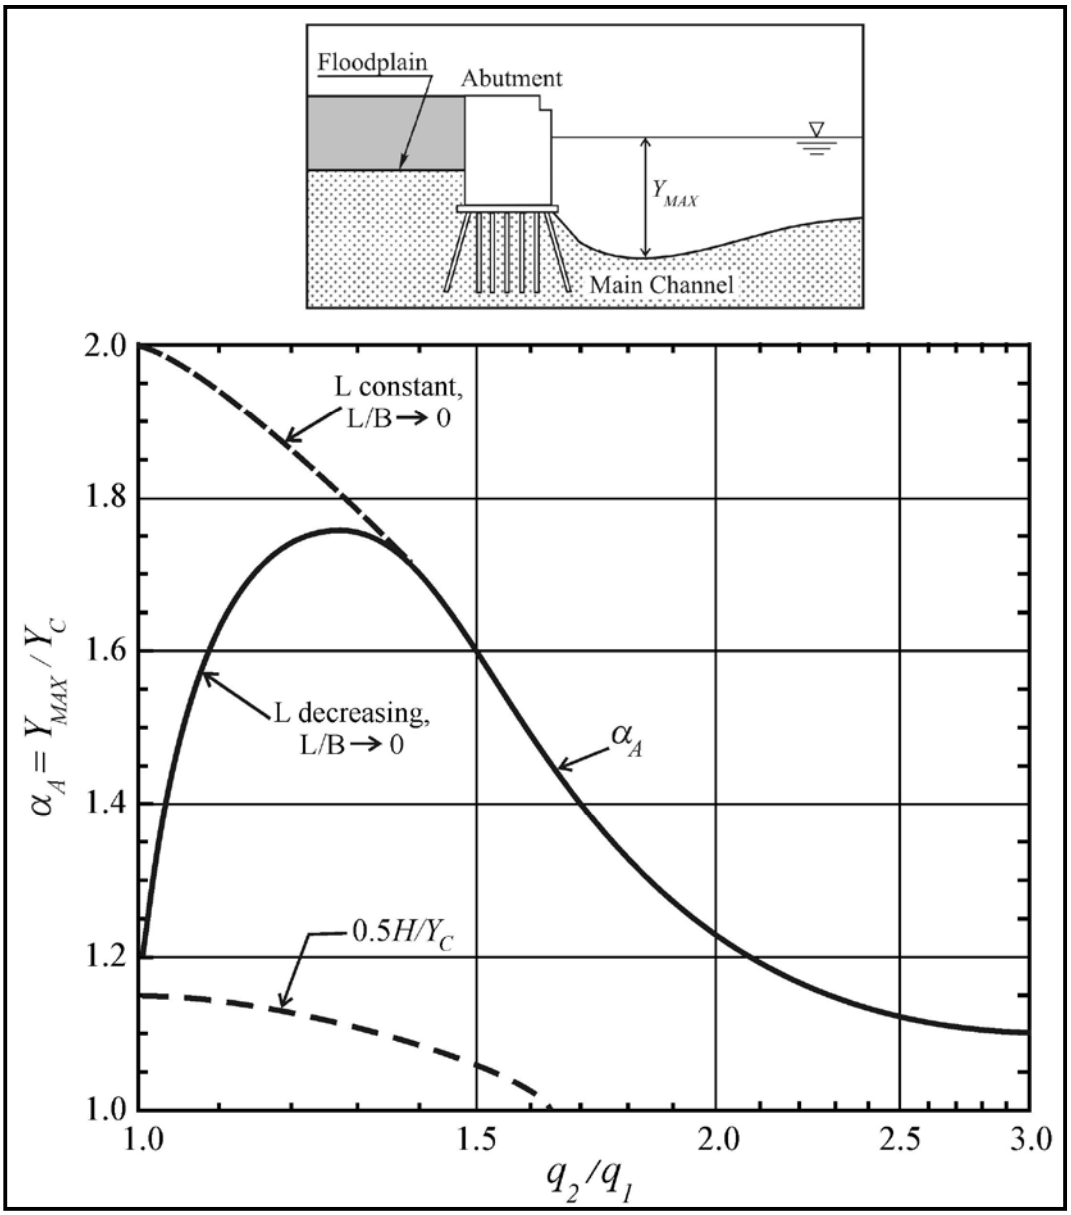

Figure 8.10. Scour amplification factor for wingwall abutments and live-bed conditions (NCHRP 2010b).

If the projected length of the embankment, L, is less than 75 percent of the width of the floodplain (B_f), scour condition (b) in Figure 8.7 occurs and the contraction scour calculation is performed using a clear-water scour calculation (see Chapter 6). The clear-water contraction scour equation also uses unit discharge (q), which can be estimated either by discharge divided by width or by the product of velocity and depth. Two clear-water contraction scour equations may be applied. The first equation is the standard equation based on grain size:

$$y_c = \left(\frac{q_{2f}}{K_u D_{50}^{1/3}} \right)^{6/7} \tag{8.6}$$

SCOUR EVALUATION

Re: Unincorporated Kane County (Elburn)
Section 107B-I-1
IL-47 over Blackberry Creek
(Main before D) Blackberry Creek

The proposed alternate structure is an open spill-through abutment with rolled steel beam superstructure design that will replace the existing 4 barrel box culvert. The bridge span will be 76 feet and will have a deck width of 62 feet. The channel velocity through the proposed structure is calculated to be 2.8 fps for the 100-year event. Proposed countermeasures will be needed to protect the open abutment at the expected velocity.

Hydraulic Design Data

Contraction Scour

	Left	Channel	Right
Input Data			
Average Depth (ft):	0.63	5.08	
Approach Velocity (ft/s):	0.20	1.44	
Br Average Depth (ft):		5.39	
BR Opening Flow (cfs):		634	
BR Top WD (ft):		63.08	
Grain Size D50 (mm):	0.01	0.01	0.01
Approach Flow (cfs):	1.81	632.19	
Approach Top WD (ft):	14.04	86.66	
Results			
Contraction Scour not computed.			

Note: Grain Size of 0.002 mm was assumed based on the NRCS Soil Survey indicating that the soil type was Lena Muck. Lena Muck properties have no measurements for percentage of particles passing the 4 in sieve or the #200 sieve, indicating that the soil particles are silt. An approximate diameter of silt(organic) particles is assumed to be 0.002 mm. However, a diameter of 0.01 mm was used as the results seemed unreasonable with a diameter of 0.002 mm.

17. RIP-RAP SIZING

The Rip-Rap size will be determined during Phase II design.

Illinois Department of Transportation

Permit Summary for Floodway Construction in Northeast Illinois

Applicant Agency:	Illinois Department of Transportation	County:	Kane
Route:	IL Route 47 @ Main St.	Stream:	Blackberry Creek
Section:	107B-I-1	SN:	045-2000 (existing), 045-2050 (proposed)

General Description (bridge length, bridge width, number of spans, abutment type, proposed scope of work within floodway, etc.):
Existing Facility: 4 barrel culvert 82 feet long, 40 feet wide, 45 degree Headwall, 2-6.5'x8.75' sections, 2-6.5'x10.42' sections
Proposed Improvement: Replacement of existing 4 barrel culvert with a 3-sided arch culvert with a 54' span and 13' rise. Culvert length is 70' from headwall to headwall.

1. Is the proposed work classified as repairs such as deck replacement, pavement resurfacing, or the armoring or filling of a scour hole? ☐ Yes ☒ No

2. Does the proposed work only consist of modifications to the existing structure which will occur above the regulatory 100-year flood profile? ☐ Yes ☒ No

Note: If the answer to question 1 or 2 is yes, no permit is required and questions 3 through 12 may be omitted.

3. Does the proposed work below the regulatory 100-year flood profile consist of widening of the existing structure by 12 feet or less? ☐ Yes ☒ No

Note: If yes, Regional Permit No. 2 applies and questions 4 through 9 may be omitted.

4. Is the proposed improvement, including the approach roadway, more restrictive to normal and flood flows than the existing structure? ☐ Yes ☒ No

5. Is a Channel Modification proposed? ☐ Yes ☒ No

6. Are there any buildings or structures located upstream in the 100-year floodplain within the influence of the structure backwater? ☒ Yes ☐ No

   6a. If no, does the backwater of the proposed improvement exceed the backwater of the existing structure by more than 0.1 foot? ☐ Yes ☐ No

   6b. If yes, does the proposed backwater exceed the natural high water elevation by more than 0.1 foot? ☒ Yes ☐ No

7. Are transitions required for this project? ☐ Yes ☒ No

8. Is the flood profile at the project site impacted by backwater from a downstream receiving stream? ☐ Yes ☒ No

   If yes, list frequency of starting elevation for analysis:

9. Is backwater from a downstream structure affecting the flood profile at the project site? ☒ Yes ☐ No

9a. Was the existing downstream structure used in the analysis for determining flood profile at the project site? (Attach documentation) ☒ Yes ☐ No

9b. Is the downstream structure scheduled for improvement in the next 5 years? ☒ Yes ☐ No

9c. Was the proposed downstream improvement used in the analysis? ☒ Yes ☐ No

10. Is a floodway map change required due to the proposed project? ☐ Yes ☒ No

11. Will fill or material be placed in the floodway due to the proposed work? ☒ Yes ☐ No

11a. If yes, is compensatory storage provided at the project location? (Attach a copy of completed Attachment A) ☒ Yes ☐ No

11b. If the answer to 11a is no, is compensatory storage provided at another location? If yes, give location and attach a copy of completed Attachment A. ☐ Yes ☐ No

11c. Has compensatory storage relief been granted? (Attach Documentation) ☐ Yes ☒ No

12. Coordination based on Memorandum of Agreement has occurred with Agency(ies) (Attach documentation):. ☐ Yes ☒ No

---

All engineering analysis has been performed by me or under my direct supervision.

Signature: [signature] IL/P.E. #: 062.054930

Date: 11/24/14 P.E. Expiration Date: 11/30/15

FOR DEPARTMENTAL USE ONLY

Is a permit required for this project? ☐ Yes ☐ No

If yes, specify type of permit: ☐ Floodway, ☐ Regional 1, ☐ Regional 2

Permit Summary
(Attachment A - Compensatory Storage)

Part of Permit Summary for Floodway Construction in Northeast Illinois:

☒ Phase I (Preliminary) ☐ Phase II (Final)

Applicant Agency:	Illinois Department of Transportation	County:	Kane
Route:	IL Route 47 @ Main St.	Stream:	Blackberry Creek - Main Stem
Section:	107B-I-1	SN:	045-2050

Provide the following information for Item 11:

a. Flood Water Elevations (Natural): 100-year 728.62 ft. 10-year 726.61 ft.
Normal 720.76 ft.

b. Determine the amount of fill or material being placed in the floodway:

1. Between the 100-year and 10-year flood elevation 759 cu. yds.
2. Between the 10-year and normal water elevation 0 cu. yds (FW Cut > FW fill) .

c. Determine the volume being provided to compensate for above item b:
(i.e. from structures removal, excavation, etc.)

1. Between the 100-year and 10-year flood elevation 2120 (max) cu. yds.
2. Between the 10-year and normal water elevation 1172 (max) cu. yds.

d. Mark on the exhibits the location and amount of compensatory storage to be excavated. Also show the location of floodway and floodplain boundaries. (Include a set of plans and cross sections)

Attach copy of calculations and Exhibit(s) reflecting the above finding.

All engineering analysis has been performed by me or under my direct supervision.

NOTES:
RS= River Station
The bulk of the proposed storage area is proposed to be situated at the Blackberry Inn property. This property will need to be purchased. The property acquisition is based on the assumption that storage is needed at a ratio of 1:1 times that of the floodplain fill volume (Usual rate for Kane County is 1:1.5, but the 1:1 ratio was agreed to by IDOT

20. SURVEY NOTES

The survey was completed in March of 2010 and the survey is too large to include in this printout. Please see Section 23, Compact Disc for the field notes and point files.

21. ESTIMATED WATER SURFACE ELEVATION

The estimated water surface elevation was obtained during the cross-section survey in March 2010. There is no gauge data available for this location.

This area has had flooding on numerous occasions. All lanes will be covered on Rt47 just North Of Main St and at the intersection. The creek at this area passes under Rt47 makes a dog leg turn to the south then passes under Main St. The creek has large deposits of silt /gravel on the east side of Rt47, between Rt47 and Main St., and on the south side of Main St. It's possible that the dog leg that is between Rt47 and Main St. is a very large deposit but I'm not sure of that.

Stephen:

The attached drawing shows low chord elevations, deck corners and the face of the Main Street structure. At this point, the elevations represent the minimums based on our hydraulic model and use of 21" deck beams + 5" wearing surface. Note that a deck beam bridge would be rectangular in shape due to the use of deck beams.

The minimum centerline profile elevations are for your use in developing the final Main Street profile. We understand that there may be other factors in developing the profile, such as constraints along Main Street away from the bridge and the intersection elevation relative to the upstream structure. So long as the final profile is kept at or above these minimums, the Main Street structure will meet is design intent. Please pass along the final profile when it is available. We will use it in completing our PNP for the BCR and PBDHR for the Main Street structure.

Let me know of any questions or concerns that you may have.

Regards,
Pete

Response

We have no borings at the culvert. Attached are two copies each of borings for the bridge on Main St. over Blackberry Ck, just west of IL 47. Not the best borings, only one boring extends to 31½ ft.

Bridge & Traffic Structure
FAS Route 107
Section 50 BR
Kane County
FAS Route 107 over Blackberry Creek

Mr. W. E. Baumann
Engineer of Design
Administration Building - Room 331
2300 South Dirksen Parkway
Springfield, Illinois 62764

Dear Mr. Baumann,

I am submitting herewith three foundation borings for the above captioned section. This structure is located in the northwest one-quarter of the southwest one-quarter of Section 20, Township 39 North, Range 7 East, Kane County.

The benchmark used is an "X" on the northwest wingwall of the existing bridge, Main Street over Blackberry Creek. The elevation is 728.16.

The existing structure is to be widened approximately 3 feet on each side. The existing west approach shows no signs of distress, even though the roadway has been constructed over fill and/or alluvial soils. Since the footing elevation will be below the stream-bed elevation of 718±, no stability problems are anticipated.

Very truly yours,

Sigmund Ziejewski
District Engineer

Illinois Department of Transportation

Memorandum

To:	Diane M. O'Keefe, District 1	Attn: Christopher J. Holt
From:	D. Carl Puzey	By: Jayme F. Schiff
Subject:	BRIDGE CONDITION REPORT APPROVAL	
Date:	February 22, 2012	

Highway Bridge Program
Kane County
Section 08-00385-00-BR

SN 045-0049

F.A.S. 107 (Main Street) over Blackberry Creek

The Bridge Condition Report for the above-designated bridge replacement project is hereby approved. This approval is based on concurrence from the FHWA, in their January 18, 2012 correspondence, for the use of Highway Bridge Program funding for complete replacement of the structure.

Please note approval of the project is contingent on approval by others of the proposed geometry, obtaining environmental signoffs, and any required historic structure coordination and other approvals required by statutes or the policies of the Department.

One copy of the approved report is being returned and we will retain one copy for our files. If you have any questions, contact Jim Klein at 217/782-5928 or Matt Humke at 217/782-5929.

Memorandum

To:	John A. Fortmann, District 1	Attn: Peter E. Harmet
From:	D. Carl Puzey	By: David Greifzu
Subject:	Bridges and Structures	
Date:	May 3, 2013	David L. Greifzu (cmc)

F.A.P. Route 326
Kane County

P-91-449-09
S.N. 045-2000

Illinois Route 47 over Blackberry Creek

We received the Bridge Condition Report (BCR) for the subject structure, which was submitted with your memorandum dated March 8, 2013. The report recommends a total replacement of the existing four cell box culvert due to the significant roadway improvements and the inadequate waterway opening of the existing culvert.

After reviewing the report and the existing plans, we have the following comments:

1. We have no objection with your recommendation to replace the existing structure.

2. We concur that stage construction appears feasible. The actual details will be subject to further investigation during the development of TS&L plans.

3. We have no objection with the proposed structure width, in order to accommodate 2-12 foot lanes, 2-10 foot shoulders and a 14 foot median. Please verify if the 10 foot shoulder includes only 8 foot of the paved shoulder would be carried across a bridge-type structure.

4. The structure type and length is subject to refinement during the development of TS&L plans. We recommend a larger multi-barrel box culvert and a multiple-span three sided precast bridge be investigated during the TS&L plan development stage. These buried structures offer better long term maintenance costs for the department. In addition, from a safety point of view, there is less icing problems with a buried structure versus a bridge. We will review the estimated cost of construction for both buried structure types and the bridge. The total cost for all of the structure options will need to be compiled. This should include the cost to raise the roadway to varying degrees for each option.

5. Please contact your District Geotechnical Engineer as boring data will be required at this structure. The Foundations and Geotechnical Unit can be contacted if assistance is needed regarding substructure exploration requirements or if any existing boring or foundation data is required.

The Bridge Condition Report is approved subject, to these comments.

Please note that a TS&L plan, a structure report, a refined hydraulic report and a structure geotechnical report will be required.

Please contact Marcus Christensen at (217) 785-2916 with questions pertaining to this project.
