- MOMENT TABLE NOTES:
- Is and Ss are the moment of inertia and section modulus of the steel section used in computing fs (Total & Overload).
 - Ic(n) and Sc(n) are the moment of inertia and section modulus of the composite section used in computing stresses due to live load.
 - Ic(3n) and Sc(3n) are the moment of inertia and section modulus of the composite section used in computing stresses due to superimposed dead load.
 - VR is the maximum LL + Impact shear range in span.
 - Z is the plastic section modulus used to determine the fully plastic moments in the non-composite areas.
 - Mu is the Full Plastic Moment Capacity for Compact, Braced
 - fs (Overload) is the sum of the stresses due to [M(DL) + M(s DL) + 5/3(M(LL) + M(Imp))].
 - fs (Total) is the sum of the stresses due to 1.3[M(DL) + M(s DL) + 5/3(M(LL) + M(Imp))].
 - M(DL) - moment due to dead loads on non-composite section.
 - M(s DL) - moment due to dead loads on composite section.
 - M(LL) - moment due to live load on composite section.
 - M(Imp) - moment due to live load impact on composite section.
 - Ma (Applied Moment) = 1.3[M(DL) + M(s DL) + 5/3(M(LL) + M(Imp))].
 - The values shown in the table are based on the analysis of Beam 2.
