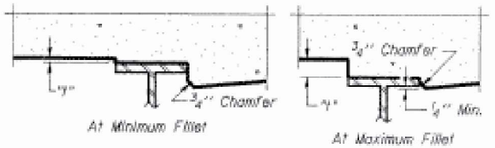
DEAD LOAD DEFLECTION DIAGRAM

(Includes weight of concrete only.)

Note:
The above deflections are not to be used in the field if the engineer is working from the grade elevations adjusted for dead load deflections as shown below.



To determine "T". After all structural steel has been erected, elevations of the top flanges of the beams shall be taken at intervals shown below. These elevations subtracted from the "Theoretical Grade Elevations Adjusted For Dead Load Deflection" shown below, minus slab thickness, equals the fillet heights "T" above top flange of beams.

GENERAL NOTES

See Foundation Boring Log Sheet in Plans.

Fasteners shall be high strength bolts. Bolts 3/4" Ø, open holes 13/16" Ø, unless otherwise noted.

Calculated weight of Structural Steel = 195,590 (M-183)
= 116,500 (M-223 Gr. 50)

The Zinc-silicate and vinyl paint system shall be used for shop and field painting of Structural Steel except where otherwise noted.

Field welding of construction accessories will not be permitted to the bottom flange of girders nor to the top flange from girder ends to splice. Field welding in other areas will be permitted only when approved by the Engineer.

Anchor bolts shall be set before bolting cross frames over supports.

The main load carrying member components subject to tensile stress shall conform to the Supplemental Requirements for Notch Toughness Zone 2. These Components are the tension flanges, webs and all splice plate material of the steel girders.

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42 or M-53 Grade 60.

Slope wall shall be reinforced with welded wire fabric, 6"x6" - W4.0 x W4.0, weighing 58 lbs. per 100 sq. ft.

Bearing seat surfaces shall be constructed or adjusted to the designated elevations within a tolerance of 1/8 inch. Adjustment shall be made either by grinding the surface or by shimming the bearing. Two 1/8" adjusting shims, of the dimensions of the top bearing plate, shall be provided for each bearing plate, in addition to all other plates or shims.

The contractor shall drive two steel test piles in a permanent location at each abutment as directed by the Engineer before ordering the remainder of piles.

All structural steel fabricators performing work on the main load carrying components of steel structures shall be certified under Category III (AISC) of the Quality Certification Program.

The Zinc-silicate and vinyl paint system shall be used for shop and field painting of Structural Steel except where otherwise noted.

Slopewall shall be reinforced with welded wire fabric, 6"x6"-W4.0xW4.0, weighing 58# lbs. per 100 sq. ft.

Field welding of construction accessories will not be permitted to the bottom flange of the girders nor to the top flange from girder ends to splice. Field welding in other areas will be permitted only when approved by the Engineer.

Anchor bolts shall be set before bolting cross frames over supports.

Bearing seat surfaces shall be constructed or adjusted to the designated elevations within a tolerance of ¼". Adjustment shall be made either by grinding the surface or by shimming the bearing. For Type I Elastomeric Bearings, two ⅛" shims of the dimensions shown on Sht. 7 shall be provided for each bearing and placed as detailed.

The main load carrying member components subject to tensile stress shall conform to the Supplemental Requirements for Notch Toughness Zone 2. These Components are the tension flanges, webs, and all splice plate material of the steel girders.

Reinforcement bars shall conform to the requirements of AASHTO M-31, M-42, or M-53 Grade 60.

See Sheet No. 8 for Steel Erection Sequence.

The contractor shall drive two test piles in permanent locations, one at the West Abutment Rear Wall and one at the East Abutment Rear Wall, as directed by the Engineer before ordering the remainder of piles.
