11. Abstract

As part of the Jane Byrne Interchange project, this report addresses evaluations for the construction of Contract 60X93 roadway ramp completion from I-290/Congress Parkway westbound (WB) to I-90/94 northbound (NB) and southbound (SB) and Contract 60X79 roadway Ramp EN completion. The improvement limits addressed in this report are Ramp EN between Stations 1611+00 and 1620+28; Ramp SE between Stations 1400+00 and 1404+75; SB Taylor Bypass between Stations 6400+75 and 6407+50 and Between Stations 6417+10 and 6424+11; EB Taylor Exit between Stations 7319+90 and 7326+26; Ramp ES between Stations 1511+39 and 1526+49; Ramp WS between Stations 1229+50 and 1241+20; and Ramp WN between Stations 1105+26 and 1108+22. The new ramps will be constructed along the outside of southbound and northbound of Interstate 90/94 to create direct exit or access to and from it. The new roadways are about 20 to 46 feet wide. The ramps approach embankments are flanked by retaining walls 14 (SN 016-1803), 20 (SN 016-1811), 46 (SN 016-1833), 47 (SN 016-1834), and 48 (SN 016-1835). The roadway improvements will be cut into the existing slopes, existing roadways, or supported by new fill and retaining walls.

Based on our subsurface investigation results, the soils consists of up to 18.5 feet of fill, up to 10 feet medium stiff to very stiff clay crust, up to 40 feet of very soft to medium stiff silty clay. Water-bearing layers are present in the fill, within the silt seams, within the soft clay, and at deeper levels within the granular materials and weathered dolostone.

Since the soft clayey subgrade will not provide a stable working platform for placement and compaction of improved aggregate subgrade; we recommend 24 inches of additional undercut below the 12 inches of IDOT Aggregate Subgrade Improvement and placing geotextile fabric at the base of the excavation for separation. Alternatively, the undercut thickness could be reduced or eliminated by using a bi-axial or tri-axial geogrid designed for the average daily traffic, axel loading, and pavement design life. The pavement sections should be designed for an average SSR value of POOR or an IBR value of 2.

The recommendations pertaining to the proposed retaining walls required to accommodate the new embankment are provided in separate structure geotechnical reports.

1.0 INTRODUCTION

This report presents the results of our geotechnical subsurface investigation, laboratory testing, and engineering analysis and evaluations for the construction of Contract 60X93 roadway ramps completion from I-290/Congress Parkway westbound (WB) to I-90/94 northbound (NB) and southbound (SB) and Contract 60X79 roadway Ramp EN completion. A *Site Location Map* is presented as Exhibit 1.

Roadway design drawings provided to Wang Engineering, Inc. (Wang) by TranSystems Corporation (Transystems) indicate the improvements include

Contract 60X79

- Ramp EN between Station 1602+81.84 and Station 1620+27.93; and

Contract 60X93

- Ramp SE between Station 1400+00.00 and Station 1412+21.28;
- SB Taylor Street Exit/Bypass Ramp between Stations 6400+75.27 and 6424+10.70;
- EB Taylor Street Exit Ramp between Station 7306+37.89 and Station 7326+25.98;
- Ramp ES between 1507+75.00 and Station 1526+48.46;
- Ramp WS between Station 1210+33.12 and 1241+20.44; and
- Ramp WN between Station 1103+05.20 and Station 1108+21.88.

Some roadway sections and structures along the alignments were addressed in Wang's various roadway and structure geotechnical reports. Table 1 summarizes structures and the roadway sections already addressed in structure geotechnical reports (SGRs) and RGRs.

Table 1: Structures and Roadway Section Addressed in SGRs and RGRs

Alignment	Old RGRs*	Structure (SN)	This RGR
Ramp EN (1602+82 to 1620+00)	1602+82 to 1607+94 (RGR[1] dated Jul. 14, 2015)	016-1712, 016-1807, and 016-1811	1611+00 to 1620+28
Ramp SE (1400+00 to 1412+21)	-	016-1714 and 016-1835	1400+00 to 1404+75
SB Taylor Street Exit/Bypass Ramp (6400+75 to 6424+11)	-	016-1718, 016-1834, and 016-1803	6400+75 to 6407+50 and 6417+10 to 6424+11
EB Taylor Street Exit Ramp (7306+38 to 7326+26)	7306+38 to 7319+90 (RGR dated Jul. 14, 2015 and RGR[2] dated Jan. 27, 2017)	-	7319+90 to 7326+26
Ramp ES (1507+75 to 1526+49)	1507+75 to 1511+39 (RGR dated Jul. 14, 2015)	-	1511+39 to 1526+49
Ramp WS (1210+33 to 1241+20)	-	016-1715 and 016-1803	1229+50 to 1241+20
Ramp WN (1103+05 to 1108+22)	-	016-1706 and 016-1833	1105+26 to 1108+22

*Previously submitted RGRs: [1] I-290 from Loomis St to I-90/94, Contract 60X77; and
[2] EB Taylor Exit Ramp, Contract 62A74.

The proposed roadway pattern shows numerous new ramps, bridges, retaining walls, and roadway alignments. The roadway sections addressed in this report will have one to two lanes with shoulders on both sides and a total width of about 20 to 46 feet. The new roadway will be constructed on either the existing embankment cut back and supported by retaining walls, existing surface cut and supported by retaining walls, new embankment fill with slopes no steeper than 1:2 (V:H) or supported by retaining walls, or at existing grade elevation.

The purpose of the investigation was to characterize the site soil, groundwater conditions, and provide geotechnical analyses and recommendations for the design and construction of the proposed pavements.

2.0 SITE AND REGIONAL GEOLOGY

The site is located within the City of Chicago at the I-90/94 and I-290 Circle Interchange. On the USGS Chicago Loop 7.5 Minute Series map, the ramps run through Sections 16 and 17 of Tier 39 N, Range 14 E of the Third Principal Meridian.

The following review of published geologic data, with emphasis on factors that might influence the design and construction of the proposed engineering works, is meant to place the project area within a geological framework and confirm the dependability and consistency of the present subsurface investigation results. For the study of the regional geologic framework, Wang considered northeastern Illinois in general and Cook County in particular. Exhibit 2 illustrates the *Site and Regional Geology*.

2.1 Physiography

The site is situated within the northern section of the Chicago/Calumet lacustrine plain (Chrzatowsky and Thompson 1992). The area's flat, lakeward-sloping surface is a wave-scoured groundmoraine covered by thin and discontinuous lacustrine offshore silt and clay (Willman 1971).

The roadway ramps get from above ground surface elevation of about 595 feet along Congress Parkway to about 577 feet along proposed I-90/94 (Dan Ryan expressway) constructed within a 20- to 25-foot deep cut.

2.2 Surficial Cover

Within the project area, 100-foot thick or more, Wisconsinan-age glacial drift covers the bedrock (Leetaru et al. 2004). The glacial cover is made up of discontinuous occurrences of clay and silt of the Equality Formation of the Mason Group and diamictons of the Wadsworth and Lemont Formations of the Wedron Group (Hansel and Johnson 1996). The Equality Formation is made up of bedded silt and clay, locally laminated, with lenses and/or thin beds of sand and gravel. The Wadsworth Formation consists of relatively homogenous, massive, gray till with clay to silty clay matrix, with dolostone and shale clasts and occasional lenses of sorted and stratified silt. The Wadsworth Formation is underlain by the pebbly silty clay loam to silty loam diamicton of the Yorkville Member of the Lemont Formation, known informally as the Chicago "hardpan."

From a geotechnical viewpoint, the Equality Formation is characterized by low strength, medium to high plasticity, and medium to high moisture content, whereas the Wadsworth Formation is

characterized by medium plasticity, medium to low moisture content, medium to very stiff consistency, poor permeability, and low compressibility (Bauer et al. 1991; Peck and Reed 1954).

2.3 Bedrock

In the project area, the glacigenic deposits unconformably rest over a 350-foot thick Silurian-age dolostone (Leetaru et al. 2004) at depths more than 100 feet below ground surface (bgs).

Our subsurface investigation results fit into the local geologic context. The borings drilled in the project area revealed the native sediments consist of clay to silty clay lacustrine deposits, silty clay diamictons, hardpan, and gravelly sands that overlie the bedrock.

2.4 Climate Data

The subsurface investigation was performed from February 2013 to December 2015. To assess the possible effects of temperature and precipitation on water table data and soil moisture, the climatic conditions for the investigation period and three months prior to the start of the investigation are summarized graphically in Figures 1 through 8. The precipitation and temperature data for the investigation period are compared against thirty-year monthly data (1981 to 2010) in box-and-whiskers format to show deviations from “normal” climate conditions during the current investigation. Local climate data were obtained from the O’Hare Station (NCDC 2015).

The deviations from the historical 30-year climate data show a relatively wet period with average temperatures for 2013 and a relatively wet with lower than average temperature for 2014. Record precipitation event of 8.68 inches was recorded in April 2013. In addition, colder than normal temperatures were recorded in November and December 2013 and January, February, March, July, and August 2014 during and/or before the investigation. Record high temperatures of 48.9F and 39F were observed in December 2012 and December 2015, respectively. These high temperatures were not doubled by precipitations. Observations of perched groundwater within the granular fill may have been influenced by these climate factors.

3.0 METHODS OF INVESTIGATION

The following sections outline the methods of subsurface and laboratory investigations. All elevations in this report are based on NAVD 1988.

3.1 Subsurface Investigation

To characterize the subsurface soil and groundwater condition along each roadway alignment included in Contracts 60X79 and 60X93, we considered data from subgrade (SGB) borings, bridge (B) borings, retaining wall (RWB) borings, and vane shear (VST) borings. The roadway alignment limits and main reference borings are summarized in Table 2.

The as-drilled boring locations and elevation were surveyed by Dynasty; stations and offsets were provided by AECOM. The boring location information is shown in the *Boring Logs* (Appendix A) and the as-drilled locations are shown in the *Boring Location Plan and Soil Profiles* (Appendix E).

Truck-mounted or ATV drilling rigs equipped with hollow stem augers were used to advance and maintain open boreholes to 10 feet and mud rotary drilling technique was used below 10 feet to boring termination depths or to the bedrock. Soil sampling was performed according to AASHTO T 206, *"Penetration Test and Split Barrel Sampling of Soils."* The soil was sampled continuously in roadway boring and at 2.5-foot intervals to 30 feet bgs and at 5-foot intervals to bedrock or boring termination depths. Soil samples collected from each sampling interval were placed in sealed jars and transported to Wang Geotechnical Laboratory in Lombard, Illinois for further examination and laboratory testing.

Table 2: Summary of Alignment and Reference Borings

Alignment	Approximate Limits		Reference Boring IDs
	Start Station	End Station	
Ramp EN	1611+00.00	1620+27.93	0461-HA-01, 1703-B-04, 1704-B-04, 1705-B06A, 1706-B-01, 1710-B-01, 1710-B-02, 1712-B-03, 1715-B-02, 2055-B-05, 21-RWB-01. 21-RWB-03, 21-RWB-04, 21-RWB-05, 22-RWB-03, 22-RWB-04, 23-RWB-01, VST-06

Ramp WN	1105+26.00	1108+21.88	1706-B-01, 1706-B-02, 1715-B-02, 2055-B-05

Field boring logs, prepared and maintained by Wang engineers, include lithological descriptions, visual-manual soil classifications (IDH Soil Classification System), results of Rimac and pocket penetrometer unconfined compressive strength tests, and results of Standard Penetration Tests (SPT), recorded as blows per 6 inches of penetration.

Groundwater observations were made in each boring during and at the completion of drilling operations. The borings were backfilled after completion, and the pavement was restored to its original condition.

3.2 Laboratory Testing

The soil samples were tested in the laboratory for moisture content (AASHTO T-265). Atterberg limits

(AASHTO T 89/T 90) and particle size (AASHTO T 88) analyses were performed to classify selected samples near the proposed roadway subgrade. Field visual descriptions of the soil samples were verified in the laboratory. The soils were classified according to the IDH Soil Classification System. Laboratory test results are shown on the *Boring Logs* (Appendix A) and in the *Laboratory Test Results* (Appendix B).

4.0 RESULTS OF FIELD AND LABORATORY INVESTIGATIONS

Detailed descriptions of the soil conditions encountered during the subsurface investigation are presented on the attached *Boring Logs* (Appendix A) and on the *Boring Location Plan and Soil Profiles* (Appendix E). Please note that strata contact lines represent approximate boundaries between soil types. The actual transition between soil types in the field may be gradual in horizontal and vertical directions.

4.1 Surface Conditions

The proposed alignments will be constructed through areas with various surficial cover, including topsoil, pavement, and demolished structures. Topsoil thicknesses measured at various locations across the site range from 3 to 18 inches with an average of 9 inches. The topsoil thicknesses are summarized in Table 3.

Table 3: Summary of Topsoil Thickness

Alignment	Number of Measurements	Topsoil Thickness Range (inches)	Average Thickness (inches)
Ramp EN	6	3-15	7
Ramp SE	3	6-12	10
SB Taylor St Exit/Bypass Ramp	5	3-14	9
EB Taylor St Exit Ramp	0	NA	NA
Ramp ES	2	6-14	10

Alignment	Number of Measurements	Topsoil Thickness Range (inches)	Average Thickness (inches)
Ramp WS	2	11-14	13
Ramp WN	0	NA	NA

The borings were drilled mainly in the roadway lanes and shoulders. Some of the borings were drilled outside the paved areas, in spaces between the ramps. The borings drilled in the existing roadway show various pavement structures consisting of asphalt, asphalt over concrete, concrete over asphalt, or just concrete. The pavement thickness as reveled by our investigation ranges from 5 to 24 inches with an average of 14 inches. The aggregate base consists of either crushed stone or gravelly sand and its thickness ranges from 4 to 48 inches. The exiting pavement thicknesses are summarized in Table 4.

Table 4: Summary of Existing Pavement Thickness and Composition

Alignment	Total Number of Measurements (No)	Pavement Structure Thickness (inches)			Pavement Average Thickness (inches)
		Asphalt No[1]/Range	Concrete No[1]/Range	Total Pavement No[1]/Range	
Ramp EN	5	5/2-18	3/10-13	5/12-18	14
Ramp SE	2	2/4-5	1/8	2/5-12	9
SB Taylor St Exit/Bypass Ramp	14	12/4-15	10/8-24	14/5-24	15
EB Taylor St Exit Ramp	9	5/5-13	6/10-24	9/10-24	15

Ramp WS	15	7/4-12	13/12-24	15/6-24	15
Ramp WN	4	4/2-16	2/10	4/12-16	14

[1]No = number of measurements along the alignment.

4.2 Soil Conditions

In descending order, the general lithologic succession encountered beneath the pavement structure and topsoil includes: 1) man-made ground (fill); 2) medium stiff to hard silty clay; and 3) very soft to medium stiff clay to silty clay. The soils deeper than the soft clay to silty clay will not impact the roadway pavement design.

1) Man-made ground (fill)

Underneath the surface (pavement or topsoil), the borings encountered 0.6 to 18.5 feet of cohesive and granular fill consisting of either medium stiff to hard, brown and gray silty clay to clay loam or very loose to very dense, brown silty loam, loam, sand to gravelly sand. The cohesive fill has unconfined compressive strength (Q_u) values of 0.7 to 6.6 tsf with an average of 2.9 tsf. Moisture content (MC) tests indicate values between 8 and 28% with an average of 17%. The granular fill material has N-values measures between 2 and more than 50 blows/foot with an average of 16 blows/foot and MC values of 4 to 57% averaging 12%. A summary of the fill properties, along each ramp alignment, is shown in Table 5.

Table 5: Summary of Existing Fill Properties

Alignment	Q_u Min-Max/Avg. (tsf)	SPT N-values Min-Max/Avg. (blows/foot)	Moisture Content Min-Max/Avg (%)	Liquid Limit Min-Max (%)	Plastic Limit Min-Max (%)
Ramp EN	0.8-6.6/3.4	6-33/15	6-26/15	NA	NA
Ramp SE	0.3-6.6/3.2	4-19/11	8-20/16	NA	NA
SB Taylor St Exit/Bypass Ramp	0.3-6.6/2.4	3-64/13	3-25/16	NA	NA
EB Taylor St Exit Ramp	0.7-1.4/1.1	4-33/20	4-23/11	NA	NA
Ramp ES	0.3-3.4/1.9	3-64/18	3-24/12	NA	NA
Ramp WS	0.3-3.4/1.7	3-64/17	3-25/14	NA	NA
Ramp WN	NA	8-11/10	16-23/20	NA	NA

2) Medium stiff to hard silty clay

Beneath the fill, most of the borings advanced through about 2- to 10-foot thick of medium stiff to hard silty clay to silty clay loam. This unit informally called "crust", has Q_u values of about 0.7 to 4.3 tsf, with an average of 1.8 tsf and is only encountered sporadically. Laboratory index testing performed on samples from this unit shows liquid limit (L_L) values of 24 to 37% and plastic limit (P_L) values of 15% to 19%. According to the AASHTO soil classification, the subgrade soil belongs mainly to the A-6 group. A summary of the unit properties along each ramp alignment is shown in Table 6.

Table 6: Summary of Crust Properties

Alignment	Q_u Min-Max/Avg. (tsf)	SPT N-values Min-Max/Avg. (blows/foot)	Moisture Content Min-Max/Avg (%)	Liquid Limit Min-Max (%)	Plastic Limit Min-Max (%)
Ramp EN	0.5-3.0/1.7	4-10/7	17-23/20	NA	NA
Ramp SE	1.0-3.5/1.5	5-8/6.6	16-24/19	NA	NA
SB Taylor St Exit/Bypass Ramp	0.3-3.0/1.5	2-16/7	8-29/21	NA	NA
EB Taylor St Exit Ramp	0.8-2.5/1.3	5-8/6	13-27/17	NA	NA
Ramp ES	0.3-3.7/1.8	5-16/8	8-26/20	NA	NA
Ramp WS	0.3-3.0/1.7	4-16/7	8-29/22	NA	NA
Ramp WN	3.28	8	19	NA	NA

3) Very soft to medium stiff clay to silty clay

At elevations 540.5 to 584.5 feet, the borings encountered about up to 40 feet of very soft to medium stiff and rarely stiff, gray clay to silty clay with Qu values of 0.03 to 0.9 tsf and occasionally 1.1 tsf with an average of 0.4 tsf and MC values of 13 to 39% averaging 25%. Laboratory index testing performed on samples from this unit shows L_L values of 27 to 41% and P_L values of 14 to 19%. According to the AASHTO soil classification, the subgrade soils belong mainly to the A-6 ans A-7-6 groups. This unit is informally known as the "Chicago Blue Clay." A

summary of the unit properties along each ramp alignment is shown in Table 7.

Table 7: Summary of Chicago Blue Clay Properties

Alignment	Q_u Min-Max/Avg. (tsf)	SPT N-values Min-Max/Avg. (blows/foot)	Moisture Content Min-Max/Avg (%)	Liquid Limit Min-Max (%)	Plastic Limit Min-Max (%)
Ramp EN	0.1-0.8/0.4	0-8/3	16-37/24	29-41	16-18
Ramp SE	0.1-0.7/0.4	0-6/3	19-28/24	33-35	17-18

Ramp WN	0.2-0.8/0.4	1-5/3	16-27/24	34	17

4.3 Groundwater Conditions

Groundwater was observed in 35 out of 100 borings along the alignments during drilling at elevations of 497.6 to 588.9 feet (2.5 to 89.0 feet bgs). After drilling, the groundwater was measured in 8 borings at elevations of 493.5 to 533.9 feet (40.0 to 91.3 feet bgs). In seven borings, groundwater was measured after 24 to 144 hours of drilling completion, and its level was recorded at elevations of 507.0 to 581.4 feet, about 8.0 and 72.0 feet bgs.

Within this project limits, Wang installed two monitoring wells in boreholes 10-PZ-01 and 1703-PZ-01. The Piezometer 10-PZ-01 was installed at Station 7315+23.78 in the proposed EB Taylor Exit Ramp and Piezometer 1703-PZ-01 was installed at Station 1104+74.81 in the proposed Ramp WN. Both Piezometers were set within silty loam to sandy loam unit below the soft “Chicago blue clay” between 72.0 and 93.0 feet bgs. The monitoring wells showed an average water table elevation of 552.7 feet and 553.4 feet, respectively. However, is known that within the soft clay unit, possible thin lenses of saturated silt are prone to release water into excavated sections trough

this unit.

During periods of precipitation, we anticipate that perched groundwater may be encountered, but otherwise the static water level is deep seated and will not impact the roadway or pavement design.

5.0 ENGINEERING ANALYSIS AND RECOMMENDATIONS

The typical pavement section from the plan set dated November 11, 2017 (Appendix D) indicates the proposed pavement section will consist of 11 inches of jointed Portland Cement Concrete (PCC) pavement over 4 inches of stabilized hot-mix asphalt (HMA) base and 12 inches of improved aggregate subgrade. However, some roadway sections will have temporary pavement section that will consist of either 13 inches of layered HMA over 4 inches of subbase granular material or 11 inches of PCC over 4 inches of subbase granular material. The analysis and recommendations include the improvements along the sections listed in Table 1.

The cross sections show the alignments sharing the embankment and roadway sections. Ramp SE and SB Taylor Road Bypass Ramp are sharing the roadway from about Station 7400+00 to Station 7403+50. Ramp WS and EB Taylor Street Exit/Bypass Ramp are sharing the embankment and pavement structure between about Station 1233+50 (7317+00) to Station 1237+00 (7320+00) and recommendations are common for the two. Ramp ES, Ramp WS, and EB Taylor Exit Ramp are sharing the subgrade from about Station 1518+00 to Station 1520+50. Within the shared sections, the treatment will refer to the entire extent of common subgrade or foundation. When finished, the ramps will include one to two lanes and shoulders on both sides. The typical pavement sections are attached in Appendix D. The proposed ramps pavement section includes temporary pavement structures of asphalt over aggregate base and design pavement structure of asphalt/concrete pavement over aggregate base. The pavement section includes 12 inches of improved aggregate subgrade.

5.1 Site Preparation and Earthwork

It is recommended that the existing topsoil be stripped within the limits of the proposed pavement, shoulders, embankment fill, and grading. For estimating purposes, the average topsoil thickness to be stripped from the surface is 10 inches. According to IDOT District One policy, a shrinkage factor of 15% should be used to measure borrowed and furnished excavation quantities.

The exposed subgrade throughout the extent of the exit ramps will be soft clay to silty clay, stiff to

hard silty clay, and granular and cohesive fill. It should be anticipated that soft clay will fail attempts at proofrolling due to excessive deflection and rutting; therefore, the proofrolling of this soil is not recommended and additional subgrade treatment should be provided, as discussed in the following section.

5.2 Subgrade Treatment and Recommendations

Based on the result of our subsurface investigation we expect the subgrade will consist of stiff to hard silty clay diamicton and very soft to medium stiff clay. Table 8 summarizes subgrade soil conditions and treatment areas extent.

Table 8: Summary of Subgrade Soil Condition and Treatment Extent

Alignment	Stations	Width	Subgrade Soil Type and Properties	Recommended Treatment /Depth (inches)
Ramp EN	1613+60 to 1613+89	full width	Settlement >1inch	LCCF[2]/ see SGR for SN 016-1811
	1613+89 to 1619+50	full width	Very soft to med stiff clay (**Unit 3**) Qu=0.1-0.9 tsf ; N=0-5bw/ft; MC=28-31%; moist to wet	24[1]
Ramp SE	1404+50 to 1404+89	full width	Settlement >1inch	LCCF[2]/ see SGR for SN 016-1835
SB Taylor St Bypass Ramp	6404+00 to 6405+49	full width	Very soft to med stiff clay (**Unit 3**) Qu=0.2-0.6 tsf ; N=1-5bw/ft; MC=20-26%; moist to wet	24[1]
	6405+49 to 6407+69	full width	Settlement >1inch	LCCF[2]/ see SGR for SN 016-1834
SB Taylor St Bypass Ramp, (EB Taylor St, and Ramp WS)	6421+00 to 6424+11; (~7317+00 to 7320+00; ~1233+50 to 1237+00)	full width	Very soft to med stiff clay (**Unit 3**) Qu=0.1-0.7 tsf ; N=0-5blw/ft; MC=20-26%; moist to wet	24[1]
EB Taylor St Exit	7319+90 to 7320+75	full width	Very soft to med stiff clay (**Unit 3**) Qu=0.1-0.5 tsf ; N=0-4blw/ft; MC=20-27%; moist to wet	24[1]

Alignment	Stations	Width	Subgrade Soil Type and Properties	Recommended Treatment /Depth (inches)
Ramp ES	1511+39 to 1512+25	CL to 28 RT[3]	Very soft to med stiff clay (**Unit 3**) Qu=0.2-0.7tsf ; N=3-5blw/ft; MC=20-27%; moist to wet	24[1]
	1512+25 to 1513+25	15 RT to 28 RT	Very soft to med stiff clay (**Unit 3**) Qu=0.3-0.7tsf ; N=3-4blw/ft; MC=24-28%; moist to wet	24[1]
	1513+25 to 1517+75	medians and between existing roads	Match the existing subgrade	up to 24[1]
Ramp WS	1229+60 to 1230+50	full width	Settlement >1inch	LCCF[2]/ see SGR for SN 016-1803
	1233+50 to 1241+20	full width	Very soft to med stiff clay (**Unit 3**) Qu=0.1-0.7 tsf ; N=0-5blw/ft; MC=20-26%; moist to wet	24[1]
Ramp WN	1105+04 to 1105+50	full width	Settlement >1inch	LCCF[2] / see SGR for SN 016-1833

[1] Alternative: The 24 inches of undercut treatment can be reduced to 12 inches of undercut or eliminated by placing bi-axial or tri-axial geogrid. **The geogrid could be used within wall limits and reduce the undercut thickness to not interfere with the walls structural design.** The geogrid is designed specifically for the proposed average daily traffic volume, design life of the pavement, number of proposed axels, and axel loads;

[2]IDOT District One Class III Lightweight Cellular Concrete Fill (LCCF) for recommendation see SGRs;

[3]Offset from proposed alignment.

At locations shown in Table 8 the subgrade soil will not provide a stable working platform for placement and compaction of improved subgrade aggregate. At the base of the undercut excavation, we recommend placing of geotextile fabric for ground separation according to Section 210 (2016). The improved subgrade should be in accordance with the Bureau of Design and Environment special provision, *Aggregate Subgrade Improvement.*

5.3 Subgrade Support Rating

Laboratory testing on the subgrade soils shows a Subgrade Support Rating (SSR) of POOR to

FAIR. The pavement should be design based on SSR of POOR or on an IBR of 2, as per IDOT correlation to the A-7-6 soil classification encountered during the investigation (IDOT, 2015).

5.4 Roadway Drainage

The proposed subgrade and pavement should have proper surface grading to remove water accumulations and prevent the pooling of water. The clayey subgrade, encountered immediately beneath the proposed roadway pavement, have high clay and silt contents and will exhibit poor drainage characteristics. Although the soils are not frost susceptible, the installation of four-inch diameter transverse underdrains at the low points in the proposed profile and at 300-foot intervals between is recommend to ensure the long-term performance of the pavement. The underdrains should be installed at a depth immediately below the base of improved subgrade elevation and should not be wrapped in filter fabric.

5.5 Embankment Cuts

The existing embankments and slopes along SB and NB I-90/94 will be cut as part of the widening and realignment of the roadway section. To support the proposed cuts, several retaining walls will be constructed. Table 9 summarizes the structures along the proposed alignments. The retaining walls design was addressed in separate structure geotechnical reports.

Table 9: Summary of Structures

Alignment	Wall Number	Structure Number	Approximate Location
Ramp EN	20	SN 016-1811	North approach embankment
Ramp SE	48	SN 016-1835	North approach embankment
SB Taylor St Bypass	47	SN 016-1834	North approach embankment
	14	SN 016-1803	South approach embankment
Ramp WS	14	SN 016-1803	South approach embankment
Ramp WN	46	SN 016-1833	North approach embankment

5.5.1 Settlement

The approach roadway embankments are retained on each side by walls. By using regular IDOT fill (unit weight of 125 pcf), the embankment will undergo up to 4.5-inch settlement within the highest embankment sections. The treatment recommendations in Table 8 will reduce the settlement to 1 inch or less. The MSE retaining walls are designed with IDOT District One Class III LCCF and sometimes with ground improvement to satisfy the settlement criterion for the roadway.

5.5.2 Global Stability

The slopes along the ramp sections will be graded from 1:3 to 1:6 (V:H). Walls retain most of the ramps embankments. We estimate the slopes outside the walls meet the IDOT required minimum FOS of 1.5 where fill and 1.7 were in cut.

6.0 CONSTRUCTION CONSIDERATIONS

6.1 Excavation, Dewatering, and Utilities

Foundation excavations should be performed in accordance with local, State, and federal regulations. The potential effect of ground movements upon nearby roadways and utilities should be considered during construction. Excavations should be sloped at no greater than 1:2 (V:H). Excavations required to reach the base elevations of the retaining walls, as well as for undercutting, may require dewatering. Groundwater might be present within the soft clay (Unit 3) and in granular lenses encountered throughout. The Contractor should ensure proper surface grading to prevent the pooling of run-off into open excavations. Any water allowed to enter excavations should immediately be removed via sump pump.

6.2 Filling and Backfilling

General fill used as embankment material should be structural fill except as noted in Section 5.2. Pre-approved, compacted, cohesive or granular soil conforming to Section 204, *Borrow and Furnished Excavation* would be acceptable as structural fill (IDOT 2015). The fill material should be free of organic matter and debris and should be placed in lifts and compacted in accordance to Section 205, *Embankment.* The existing fill material excavated from the embankments may be reused elsewhere if it conforms to the following criteria: a) L_L less than 50%; b) plasticity index less than 20%; c) maximum dry density greater than 90 pcf according to AASHTO T 99; and d) organic content less than 10%.

6.3 Earthwork Operations

The required earthwork can be accomplished with conventional construction equipment. Moisture and traffic will cause deterioration of exposed subgrade soils. Precautions should be taken by the contractor to prevent water erosion of the exposed subgrade. A compacted subgrade will minimize water runoff erosion.

Earth moving operations should be scheduled to not coincide with excessive cold or wet weather (early spring, late fall or winter). Any soil allowed to freeze or soften due to the standing water should be removed. Wet weather can cause problems with subgrade compaction.

It is recommended that an experienced geotechnical engineer be retained to inspect the exposed subgrade, monitor earthwork operations, and provide material inspection services during the construction phase of this project.

7.0 QUALIFICATIONS

The analysis and recommendations submitted in this report are based upon the data obtained from the borings drilled at the locations shown on the boring logs and in Appendix E. This report does not reflect any variations that may occur between the borings or elsewhere on the site, variations whose nature and extent may not become evident until the course of construction. In the event that any changes in the design and/or location of the roadway are planned, we should be timely informed so that our recommendations can be adjusted accordingly.

It has been a pleasure to assist AECOM and the Illinois Department of Transportation on this project. Please call if there are any questions, or if we can be of further service.

Respectfully Submitted,

WANG ENGINEERING, INC.

GENERAL NOTES

Begin Drilling: **08-10-2014** Complete Drilling: **08-10-2014**
Drilling Contractor: **Wang Testing Services** Drill Rig: **CME-55 TMR [85%]**
Driller: **R&J** Logger: **S. Woods** Checked by: **C. Marin**
Drilling Method: **2.25" HSA to 10', mud rotary thereafter, boring backfilled upon completion**

WATER LEVEL DATA

While Drilling: **Rotary wash**
At Completion of Drilling: **mud in the borehole**
Time After Drilling: **NA**
Depth to Water: **NA**

The stratification lines represent the approximate boundary between soil types; the actual transition may be gradual.

GENERAL NOTES

Begin Drilling: **03-27-2014** Complete Drilling: **03-31-2014**
Drilling Contractor: **Wang Testing Services** Drill Rig: **D-50 TMR [78%]**
Driller: **R&J** Logger: **M. de los Reyes** Checked by: **C. Marin**
Drilling Method: **2.25" SSA to 10', mud rotary thereafter, boring backfilled upon completion**

WATER LEVEL DATA

While Drilling: **Rotary wash**
At Completion of Drilling: **mud in the borehole**
Time After Drilling: **NA**
Depth to Water: **NA**

The stratification lines represent the approximate boundary between soil types; the actual transition may be gradual.

Drilling Method: **2.25" SSA to 10', mud rotary thereafter, boring backfilled upon completion**

WATER LEVEL DATA

While Drilling: **Rotary wash**
At Completion of Drilling: **mud in the borehole**
Time After Drilling: **NA**
Depth to Water: **NA**

The stratification lines represent the approximate boundary between soil types; the actual transition may be gradual.

GENERAL NOTES

Begin Drilling: **08-05-2014** Complete Drilling: **08-05-2014**
Drilling Contractor: **Wang Testing Services** Drill Rig: **D-25 ATV [93%]**
Driller: **P&N** Logger: **M. de los Reyes** Checked by: **C. Marin**
Drilling Method: **2.25" HSA to 10', mud rotary thereafter, boring backfilled upon completion**

WATER LEVEL DATA

While Drilling: **Rotary wash**
At Completion of Drilling: **mud in the borehole**
Time After Drilling: **NA**
Depth to Water: **NA**

The stratification lines represent the approximate boundary between soil types; the actual transition may be gradual.

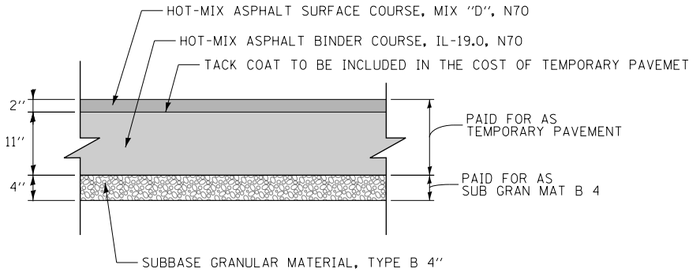
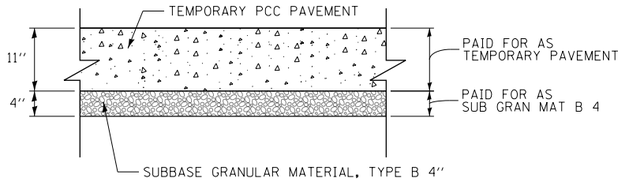
TEMPORARY PAVEMENT DETAILS:

DETAIL A: FULL DEPTH TEMPORARY HMA PAVEMENT



TEMPORARY HMA PAVEMENT

DETAIL B: TEMPORARY PCC PAVEMENT



TEMPORARY PCC PAVEMENT

TEMPORARY PAVEMENT GENERAL NOTES:

1. THE CONTRACTOR SHALL HAVE THE OPTION OF USING HMA OR PCC SECTION FOR TEMPORARY PAVEMENT, UNLESS OTHERWISE SHOWN ON THE PLANS.
2. TEMPORARY HMA TEMPORARY PAVEMENT SHALL CONSIST OF TWO ITEMS: HMA BINDER COURSE AND HMA SURFACE COURSE.
3. PORTLAND CEMENT CONCRETE TEMPORARY PAVEMENT SHALL CONSIST OF CLASS PV CONCRETE MEETING THE REQUIREMENTS OF ARTICLE 1020 OF THE STANDARD SPECIFICATIONS. TEMPORARY PCC PAVEMENT DOES NOT REQUIRE DOWEL BARS.

HOT MIX ASPHALT MIXTURE REQUIREMENTS

MIXTURE TYPE	AIR VOIDS (%) @NDES	QMP
PAVEMENT RECONSTRUCTION		
EB I-290		
STABILIZED SUBBASE - HOT-MIX ASPHALT, 4" (HMA BINDER IL-19MM)	3% @ 50 GYR	QCP
CONGRESS PARKWAY		
HOT-MIX ASPHALT SURFACE COURE, MIX "D", N70 (IL-9.5 MM): 1½	4% @ 70 GYR	QC/QA
HOT-MIX ASPHALT BINDER COURSE, IL-19.0, N70: 2¼	4% @ 70 GYR	QC/QA
UIC PARKING LOT		
HOT-MIX ASPHALT SURFACE COURSE, MIX "D", N70 (IL-9.5MM): 2"	4% @ 70 GYR	QC/QA
HOT-MIX ASPHALT BASE COURSE, (HMA BINDER IL-19 MM): 8"	4% @ 70 GYR	QC/QA
TEMPORARY PAVEMENT (IF HMA OPTION IS SELECTED BY CONTRACTOR)		
EB I-290 / RAMP EN / RAMP ES		
HOT-MIX ASPHALT SURFACE COURSE, MIX "D", N70, (IL-9.5 MM): 2"	4% @ 70 GYR	QC/QA
HOT-MIX ASPHALT BINDER COURSE, IL-19.0, N70: 11" (IN 4 LIFTS)	4% @ 70 GYR	QCP
TEMPORARY ASPHALT PAVEMENT TRANSITION		
EB I-290 / RAMP EN / RAMP ES		
HOT-MIX ASPHALT SURFACE COURSE, MIX "D", N70 (IL-9.5 MM): 2"	4% @ 70 GYR	QC/QA
HOT-MIX ASPHALT BINDER COURSE, IL-19.0, N70: VARIABLE DEPTH	4% @ 70 GYR	QC/QA
PATCHING		
EB I-290		
CLASS D PATCH (HMA BINDER IL-19 MM)	4% @ 70 GYR	QC/QA
TEMPORARY ENTRANCE		
MORGAN STREET		
HOT-MIX ASPHALT SURFACE COURSE, MIX "D", N70 (IL-9.5 MM): 2"	4% @ 70 GYR	QC/QA
HOT-MIX ASPHALT BASE COURSE, (HMA BINDER IL-19 MM): 8"	4% @ 70 GYR	QC/QA
QMP DESIGNATION: QUALITY CONTROL/QUALITY ASSURANCE (QC/QA); QUALITY CONTROL FOR PERFORMANCE (QCP)		

1. THE UNIT WEIGHT USED TO CALCULATE ALL HMA SURFACE MIXTURE QUANTITIES IS 112 LBS/SQ YD/IN.
2. THE "AC TYPE" FOR POLYMERIZED HMA MIXTURES SHALL BE "SBS/SBR PG 76-22" AND FOR NON-POLYMERIZED HMA THE AC TYPE SHALL BE "PG 64-22" UNLESS MODIFIED BY DISTRICT ONE SPECIAL PROVISIONS. FOR USE OF RECYCLED MATERIALS SEE DISTRICT ONE SPECIAL PROVISIONS.
3. QUALITY MANAGEMENT PROGRAM (QMP) IDENTIFIES THE PARTICULAR QUALITY CONTROL SPECIFICATION THAT APPLIES TO THE HMA MIXTURE.
