LOCATION DRAINAGE STUDY

PROJECT ROUTE: Illinois 43 (Harlem Avenue)
LIMITS: at 95th Street Interchange
COUNTY: Cook
JOB NUMBER: P-91-138-99

PREPARED BY: District One
Bureau of Programming
Hydraulics Section

DATE: Rev. March 25, 2002

October 1998 Version

Illinois Department of Transportation

Memorandum

To:	John Kos	Attn: Patrick Pechnick
From:	Ralph E. Anderson	By: Todd E. Ahrens
Subject:	Hydraulic Report	
Date:	July 10, 2002	

IL43 (Harlem Avenue) at 95th Street
Cook County

P-91-138-99
S.N. 016-PS25

Pump Station #25

Reply is made to your memorandum of April 5, 2002, in which you submitted the Hydraulic Report for the above location. We have also received from your office a copy of review comments made by the Bureau of Electrical Operations, which are dated May 28.

We concur with the consultant's assessment of existing conditions. PS25 conveys considerable off-site drainage. Overflow from the Village of Bridgeview's detention basin northwest of the station constitutes a great percentage of the design inflow to PS25. The report documents that the basin's watershed is roughly 250 acres of what is considered to be off-site drainage. It also notes that flow through the basin's 15-inch pipe outflow restrictor bypasses PS25, while spillway overtopping moves southeast to the PS25 collection system. The special provisions of the 1994 permit for the basin issued by the Metropolitan Water Reclamation District of Greater Chicago specify a 24-inch outlet pipe. The smaller, 15-inch pipe contributes to higher stages in the basin that lead to larger and more frequent overtopping flows that are pumped out by our station.

We also concur with the consultant's preferred Alternate #1. It recommends constructing a berm around the basin to raise the spillway and restoring the outflow pipe to its as-permitted 24-inch diameter. TR-20 analysis supports the conclusion that modifying the detention basin in this manner will reduce the peak design inflow to roughly 50 cfs. This alternate also includes a recommendation to reduce total pumping capacity to levels consistent with reduced inflows. Alternate 1 is the most economical option available to us and probably the "cleanest" solution regarding off-site flow. We feel that coordinating this with the Village of Bridgeview is a worthwhile effort.

BEO wants to retain existing pumping capacity; a position that we agree with. The additional pumping capacity in excess of peak inflow will provide a safeguard against potential increased runoff from the interchange improvement. More importantly, in the event that the detention basin is not modified as desired in Alternate #1, or if the basin does not operate as intended for whatever reason, the additional pumping capacity will be critical. BEO also stated that they will coordinate the on-off cycling of the pumps.

Alternate #1 also includes two small detention basins within proposed interchange infields. BEO notes the 4-inch restrictor outlet proposed for each infield can be enlarged if the current pumps are retained. If that is the case and off-site detention flow is also mitigated as proposed in Alternate #1, detention in these small infield basins will not be needed.

There are several minor improvements proposed that are attached to all pump station alternates. They include sewer laterals, inlet relocation, and ditch grading to address identified problems. These recommendations are well documented and also have our concurrence.

- ☐ Local Agency

1-01.2 Description:

Village of Oak Lawn reported flooding in residential backyards south of Ramp G in the southeast quadrant of the interchange during the August 2, 2001 storm event, due to apparent runoff from Ramp G flowing into the backyards. This storm event

produced approximately 3.5 inches of rain within one hour, which is greater than a 100-year storm event.

Responsibility ☒ IDOT ☐ Others

Action

The drainage system of the interchange is not designed to accommodate a storm event greater than a 100-year storm. However, a field survey of the area was performed. A ditch exists at the toe of the slope from Ramp G, to convey runoff to the storm sewer system. However, this ditch has filled with debris and silt, and no longer has a positive slope towards the storm sewer system. It appears that regrading the ditch at a constant slope from the inlet to the upstream end would create a positive 0.7% slope on the ditch. Additionally, widening the ditch to 9' wide at the bottom and creating 3:1 side slopes for a one-foot depth would create sufficient capacity to convey runoff from the 100-year storm to the inlet.

1-01.3 Description:

The Village of Chicago Ridge reported flooding problems at the intersection of Harlem Avenue and the eastern frontage road, near 98th Street. The drainage problems appear to be the result of runoff from Harlem Avenue. A catch basin located on Harlem Avenue just north of the eastern frontage road is located within the roadway pavement, outside of the curbline. Runoff flows from the 95th Street overpass down Harlem Avenue along the curbline, and bypasses the catch basin located outside of the curbline. Runoff follows the curbline as it wraps to the east at the frontage road. The curbline ends prior to the intersection of the frontage road and 98th Street, and runoff flows off the roadway across the shoulder and into a grassed depressional area between Harlem Avenue and the Harlem Avenue frontage road. Inlets/catch basins located in those depressional areas may also clog.

Responsibility: ☒ IDOT ☐ Others

Action:

Relocating the catch basin on Harlem Avenue from the roadway to the curbline to capture Harlem Avenue runoff should reduce drainage problems in the area. Additionally, inlets and storm sewers in the depressional areas should be inspected, and any debris accumulation should be removed to facilitate drainage of those areas. The total flow to the catch basin from Harlem Avenue is 1.2 cfs in the 50-year storm event. An inlet capacity analysis shows that the inlets located upstream of the catch basin appear to have sufficient capacity to handle runoff without bypassing flow.

1-02 IDENTIFIED BASE FLOODPLAINS (see Exhibit 1-02a Flood Boundary and Floodway Map or Flood Insurance Rate Map and Section 3-00)

The Flood Boundary and Floodway Map for the Village of Palos Hills and/or the County of Cook were examined for identified base floodplains which were either traversed by or adjacent to Illinois Route 43 (Harlem Avenue) at 95th Street.

Floodplains	☒ YES	☐ NO
Floodways	☒ YES	☐ NO

Note: Floodplain and floodway is at Stony Creek, approximately 7,100 feet downstream of the IL Route 43 – 95th Street interchange. The storm sewers which drain the interchange discharge to Stony Creek, but no improvements are proposed at or near Stony Creek.

1-03 MAJOR DRAINAGE FEATURES (see Exhibit 1-00a)

1-03.1 Pump Station

Location: Southwest Quadrant of Illinois Route 43 (Harlem Avenue) at 95th Street Interchange

Pump Station No.: 25

Hydraulic Report Prepared by Earth Tech in August, 2001

Waterway Information Table Available:

☐ Yes (Exhibit 1-03.1a)
☒ No

Narrative Summary:
The existing pump station is in relatively good condition and exceeds the current and anticipated capacity requirements for the interchange. However, the age of the existing equipment in the pump station, and the limited availability of repair and replacement parts for the equipment suggest that rehabilitation of the pump station is necessary for continued service.

2-00 PROPOSED DRAINAGE SYSTEM (☒ Exhibit 2-00a, Proposed Drainage Plan)

2-01 DESIGN CRITERIA (☒ Exhibit 2-01 - Typical Sections)

☐ Construction ☒ Reconstruction ☐ Rehabilitation

1. Proposed storm sewer conveyance systems will be designed for a 50 year storm frequency with a velocity between 900mm/sec (3 ft/sec) and 3000mm/sec (10 ft/sec).

   ☒ Yes ☐ No ☐ N/A

2. Proposed ditches will be designed for a 50 year storm frequency and desirable ditch grades will be no less than 0.5%.

   ☐ Yes ☐ No ☒ N/A

3. The crown grade of the roadway in a floodplain will be a minimum of 900mm (3 feet) above highwater (backwater) for the flood frequency for which the roadway is designed.

   ☐ Yes ☐ No ☒ N/A

4. The low chord of the superstructure (bridge) will be a minimum of 600mm (2 feet) above design highwater (natural) and will not be below the all time record highwater.

   ☐ Yes ☐ No ☒ N/A

5. The waterway openings of bridges and culverts will be designed for a (30, 50) year storm frequency.

☐ Yes ☐ No ☒ N/A

6. The vertical alignment for curbed pavements will have a minimum grade of 0.3% and a drainage maximum "K" value of 51 (167 English Unit).

☒ Yes ☐ No ☐ N/A

A drainage design exemption is not required at this stage based on the proposed scope of work. If the scope of work is changed during the P.S. & E. stage, the appropriate drainage design exemption approval, if any, will be processed through the Hydraulics Section by the District's Bureau of Design.

2-02 OUTLET EVALUATION

Unless otherwise noted below, the various outlets within the limits of the subject improvement were determined to be suitable for continued use under proposed conditions without modifications or the provision of stormwater detention.

Unsuitable outlets: ☐ Yes ☒ No

Sensitive outlets: ☒ Yes ☐ No

Location: Outfall at Stony Creek.

Source: Storm Sewer from Illinois Route 43 & 95th Street Interchange.

Evaluation: Stony Creek is sensitive due to downstream communities which have flooding problems. The peak flow into Stony Creek should not be increased. During the 50-year storm event, the discharge into Stony Creek decreases from 263.69 (existing) to 234.8 cfs (proposed.) Note that the flow rate from the pump station is 80.1 cfs in the existing condition and 53.5 cfs in the proposed condition (Alternatives 1, 2, 3a and 3b) for the 50-year storm event. In the 100-year event, the existing flow rate is 80.1 cfs and the proposed flow rate from the pump station is 53.5 cfs, 71.2 cfs and 80.1 cfs for Alternatives 1 and 2, Alternative 3a, and Alternative 3b, respectively.

Recommendation: Outlet suitable for continued use.

2-03 STORM WATER DETENTION ANALYSIS

This project has been reviewed in accordance with Drainage Manual, Section 1-303.035 "Storm Water Storage".

2-03.1 Evaluation

☒ Storm water detention required

Sensitive outlets (see Section 2-02)

Location:

The Harlem Avenue storm sewer discharges to Stony Creek at Harlem Avenue, 7080' south of the interchange. The outlet is sensitive but is suitable for continued use; however, the flow rate to Stony Creek must not increase in the proposed condition. Due to overtopping of the Central Detention Pond in the 50- and 100-year storm events (existing,) detention is required to control the overflow from the Central Detention Pond, prevent flooding in the interchange, and prevent an increase in discharge to Stony Creek. Several alternatives are available for providing the required detention. These are summarized in section 2-03.2 and described in greater detail in Section 2-05.

The storm sewer analysis shows that during the critical duration 50-year storm, the existing peak flow into the creek is 263.69 cfs, and the proposed peak flow into the creek is 234.8 cfs. As the outlet is suitable for continued use, no detention is required for Stony Creek.

2-.03.2 Recommendation – Alternative 1

Detention Ponds ☒ Yes ☐ No

For Outlet at Westbound 95th Street Station 605+81, 179' Lt.

70,052 Cubic meters (91,621 Cu. Yds.) for a 100 year storm frequency. (The existing Central Detention Pond provides 54,289 cubic meters (71,002 cu. yds.) of storage. This alternative includes raising the overtopping berm to provide 15,765 cubic meters (20,619 cubic yards) of additional storage in the existing pond. See Section 2-05 for additional information.)

Pond Location: The Central Detention Pond is located east of I-294, north of 95th Street, and south of the railroad.

For Outlet at Westbound 95th Street Station 616+03, 86' Lt.

555 Cubic meters (726 Cu. Yds.) for a 100 year storm frequency. See Section 2-05 for additional information.

Pond Location: Northwest quadrant of interchange.

For Outlet at Eastbound 95th Street Station 705+65, 57' Rt.

740 Cubic meters (968 Cu. Yds.) for a 100 year storm frequency. See Section 2-05 for additional information.

Pond Location: Southwest quadrant of interchange.

Storage Pipes ☐ Yes ☒ No

Oversizing storm sewers/ditches ☐ Yes ☒ No

Control structure schematics (see Exhibit 2-03.2a)

☒ Yes ☐ No

4" non-clogging restrictor at inlet "W" (eastbound 95th Street Station 705+65, 57' Rt.)

4" non-clogging restrictor at inlet "D" (westbound 95th Street Station 616+03, 86' Lt)

Replace 15" outlet with 24" outlet at Central Detention Pond (westbound 95th Street Station 605+81, 179' Lt.)

Detailed evaluation and supporting calculations are included in Appendix D.

☒ Yes ☐ No

2-.03.2 Recommendation – Alternative 2

Detention Ponds ☒ Yes ☐ No

For Outlet at Westbound 95th Street Station 605+81, 179' Lt.

70,052 Cubic meters (91,621 Cu. Yds.) for a 100 year storm frequency. (The existing Central Detention Pond provides 54,289 cubic meters (71,002 cu. yds.) of storage. This alternative includes raising the overtopping berm to provide

15,765 cubic meters (20,619 cubic yards) of additional storage in the existing pond. See Section 2-05 for additional information.)

Pond Location: The Central Detention Pond is located east of I-294, north of 95th Street, and south of the railroad.

For Outlet at Westbound 95th Street Station 616+03, 86' Lt.

22,203 Cubic meters (29,040 Cu. Yds.) for a 100 year storm frequency. See Section 2-05 for additional information.

Pond Location: Northwest quadrant of interchange

For Outlet at Eastbound 95th Street Station 705+65, 57' Rt.

740 Cubic meters (968 Cu. Yds.) for a 100 year storm frequency. See Section 2-05 for additional information.

Storage Pipes ☐ Yes ☒ No

Oversizing storm sewers/ditches ☒ Yes ☐ No

For Outlet at Westbound 95th Street Station 610+41, 50' Lt.

1826 Cubic meters (2,388 Cu. Yds.) for a 100 year storm frequency

Oversized Storm Sewer Location: North of 95th Street, east of the Central Detention Pond, and west of the Railroad, to collect overflow from the Central Detention Pond.

Control structure schematics (see Exhibit 2-03.2a)

☒ Yes ☐ No

4" non-clogging restrictor at inlet "W" (eastbound 95th Street Station 705+65, 57' Rt.)

4" non-clogging restrictor at inlet "D" (westbound 95th Street Station 616+03, 86' Lt)

33" restrictor at inlet "A" (westbound 95th Street Station 610+41, 50' Lt.)

Detailed evaluation and supporting calculations are included in Appendix D.

☒ Yes ☐ No

2-04 RIGHT OF WAY ANALYSIS

☒ Yes ☐ No The right of way requirements have been coordinated with and accepted by the Project and Environmental Studies Section and Bureau of Design.

☒ Yes ☐ No Existing/Proposed right of way is sufficient to accommodate the proposed drainage system.

☐ Yes ☒ No Additional right of way is required to accommodate the proposed drainage system.

☐ Yes ☒ No A drainage easement is required to accommodate the proposed drainage system.

2-05 DRAINAGE ALTERNATIVES

Three drainage alternatives were analyzed to improve performance of the pump station and reduce flooding of the intersection during the 50- and 100-year storm. As described in the hydraulic report, the Central Detention Pond located east of the Tollway and north of 95th Street normally discharges to the south and away from the pump station service area. However, in most 50- and 100-year storm events, runoff overtops the Central Detention Pond and enters the pump station service area.

The existing pump station does not have sufficient capacity to handle the overflow from the Central Detention Pond. The wet well fills beyond the low pavement elevation of 587.5, water begins bubbling out of the inlets, and the interchange floods.

An analysis of the Central Detention Pond was conducted to determine whether modifications to the pond could prevent the pond from overtopping in all storm events. It was determined that the berm would need to be raised to elevation 615, approximately. Due to space constraints and upstream development, it is not possible to raise the berm of the pond beyond 612. Therefore, three alternatives were analyzed to reduce flooding of the interchange during the 50- and 100-year storm event. Alternatives 1 and 2 considered adding detention storage upstream of the pump station, and Alternatives 3a and 3b considered adding pumps in the pump station in addition to creating additional storage upstream.

Alternative 1: Storage and Restrictor Replacement (See Exhibit 2-04)

Detention storage can be provided upstream of the pump station to reduce the 100-year peak flows into the pump station. Reducing the peak inflow to the pump station will allow the three 8000 gpm pumps (designed for the 50-year storm event) to function during the 100-year storm event without flooding of the intersection.

This alternative includes constructing a berm to elevation 610.5 around the south and southwest edges of the Central Detention Pond, and replacing the 15" restrictor with the 24" restrictor as the pond was designed. The pond currently overtops at elevation 608.0. Raising the berm and increasing the outlet will prevent overtopping of the pond during the 50-year storm event and reduce overtopping during the 100-year storm event. (The TR-20 analysis shows the pond filling to a maximum elevation of 608.91 in the 50-year, 24-hour storm.)

This alternative also includes construction of two small detention storage basins within the interchange infields to reduce the peak flow from the interchange itself into the pump station. The peak flow from the interchange occurs during the 2-hour storm event; however, the peak volume of runoff occurs during the 24-hour storm event. Therefore, the small infield detention storage basins are designed to store runoff from the 24-hour, 100-year event, which will reduce the peak flow to the pump station for all storm events.

One small pond is to be located adjacent to inlet "D" (westbound 95th Station 616+03, 86' Lt.) in the northwest quadrant of the site. The pond will capture runoff from drainage areas "D" and "F" and detain the runoff prior to discharge through the storm sewer system. The TR-20 analysis shows that a pond 0.65 acres in size and 1.7 feet deep will provide 0.45 acre-feet of storage, which is sufficient to detain the runoff from this area during all storm events. Sufficient area exists within the infield area to modify the shape of the pond, if a smaller and deeper pond is preferred. The analysis assumes a 4-inch orifice restricting flow into the storm sewer system at inlet "D" (westbound 95th Station 616+03, 86' Lt.)

The second small pond is to be located adjacent to inlet "W" (eastbound 95th Station 705+65, 57' Rt.) in the southwest quadrant of the site. The pond will capture runoff from drainage area "W" and detain the runoff prior to discharge through the storm sewer system. The TR-20 hydrologic analysis shows that a pond 0.45 acres in size and 2.0 feet deep will provide 0.6 acre-feet of storage, which is sufficient to detain the runoff from this area during all storm events. Sufficient area exists within the infield area to modify the shape of the pond, if a smaller and deeper pond is preferred. The analysis assumes a 4-inch orifice restricting flow into the system at inlet "W" (eastbound 95th Station 705+65, 57' Rt.)

Providing storage within the interchange, raising the berm around the Central Detention Pond, and increasing the size of the outlet from the Central Detention Pond results in a significant reduction in peak flow to the pump station. Flow from the interchange during the critical duration 100-year, 2-hour storm is reduced to 46.22 cfs. All three pumps operate during the 100-year storm, and peak elevation in the wet well is 580.30. At the storm sewer in the infield adjacent to the low point on 95th Street, the rim elevation is 585.30 and the hydraulic grade line is 582.50, providing 2.8 feet of freeboard below the rim elevation and 5.0 feet of freeboard below the pavement elevation. The pavement does not appear to flood during the 100-year storm for this alternative.

The engineer's estimated opinion of probable construction cost for this alternative is approximately $1,416,176 as shown in Hydraulic Report Exhibit 79, which includes $1,318,797 for the pump station itself (with three pumps plus one stand-by) and $97,379 for other improvements.

The stage-storage calculations can be found in Hydraulic Report Exhibits 44 and 45, and TR-20 hydrologic model can be found in Hydraulic Report Exhibit 46. The Hydra storm sewer model can be found in Hydraulic Report Exhibits 39 - 42. The pump flow diagrams and calculations for this alternative can be found in Hydraulic Report Exhibits 47-52.

Alternative 2: Storage at Central Detention Pond and Northwest Infield (See Exhibit 2-04)

Detention storage can be provided upstream of the pump station to reduce the 100-year peak flows into the pump station. Reducing the peak inflow to the pump station will allow the three 8000 gpm pumps (designed for the 50-year storm event) to function during the 100-year storm event without flooding of the intersection.

This alternative includes constructing a berm to elevation 611.0 around the south and southwest edges of the Central Detention Pond and constructing a new overflow spillway at elevation 610.5. This alternative also includes conveying the overflow from the Central Detention Pond to a new detention facility in the northwest infield. The Central Detention Pond currently overtops at elevation 608.0. Raising the berm at the Central Detention Pond will prevent overtopping of the pond during most 50-year storm events and reduce overtopping during the 100-year storm event.

The overflow from the Central Detention Pond in the 100-year storm events will be conveyed to a proposed 18 acre-foot detention storage facility in the northwest infield. A 42" storm sewer at 1.7% slope will collect the overflow from the Central Detention Pond and convey it approximately 1000 feet along the northern right-of-way of 95th Street, across the railroad, and discharge to the proposed Northwest Infield pond. The proposed Northwest Infield pond will require a 3.2 acre footprint, and will discharge through the existing 15-inch storm sewer at inlet "D" (westbound 95th Station 616+03, 86' Lt.) The existing storm sewer invert is at 582.25 and does not require modification. The existing sewer is small enough to sufficiently restrict the flow from the proposed pond. The pond is designed to store the runoff from the 100-year, 24 hour storm event. The high water level of the pond in the 100-year, 24-hour storm is 591.1. The overflow spillway crest will be at elevation 593.1 to provide 2 feet of freeboard on the pond, and the top of the berm will be at elevation 593.6.

This alternative also includes construction of a small detention storage basin within the southwest infield to reduce the peak flow from the interchange itself into the pump station. The peak flow from the interchange occurs during the 2-hour storm event; however, the peak volume of runoff occurs during the 24-hour storm event. Therefore, the small infield detention storage basins are designed to store runoff from the 24-hour, 100-year event, which will reduce the peak flow to the pump station for all storm events.

The small pond is to be located adjacent to inlet "W" (eastbound 95th Station 705+65, 57' Rt.) in the southwest quadrant of the site. The pond will capture runoff from drainage area "W" and detain the runoff prior to discharge through the storm sewer system. The TR-20 hydrologic analysis shows that a pond 0.45 acres in size and 2.0 feet deep will provide 0.6 acre-feet of storage, which is sufficient to detain the runoff from this area during all storm events. Sufficient area exists within the infield area to modify the shape of the pond, if a smaller and deeper pond is preferred. The analysis

assumes a 4-inch orifice restricting flow into the system at inlet "W" (eastbound 95th Station 705+65, 57' Rt.)

Providing storage within the northwest and southwest infield areas and raising the berm around the Central Detention Pond results in a significant reduction in peak flow to the pump station. Flow from the interchange during the critical duration 100-year, 2-hour storm is reduced to 47.13 cfs. All three pumps operate during the 100-year storm, and peak elevation in the wet well is 581.20. At the storm sewer in the infield adjacent to the low point on 95th Street, the rim elevation is 585.30 and the hydraulic grade line is 583.12, providing 2.2 feet of freeboard below the rim and 4.4 feet of freeboard below the pavement. The pavement does not appear to flood during the 100-year storm for this alternative.

The engineer's estimated opinion of probable construction cost for this alternative is approximately $1,889,102 as shown in Hydraulic Report Exhibit 79, which includes $1,318,797 for the pump station itself (with three pumps plus one stand-by) and $570,305 for other improvements. Note that this cost does not include the cost of crossing the railroad with the new conveyance pipe.

The stage-storage calculations can be found in Hydraulic Report Exhibits 44 and 45, and TR-20 hydrologic model can be found in Hydraulic Report Exhibit 53. The Hydra storm sewer model can be found in Hydraulic Report Exhibits 39 - 42. The pump flow diagrams and calculations for this alternative can be found in Hydraulic Report Exhibits 54-59.

Alternative 3: Storage and Pumps (See Exhibit 2-04)
The berm around the Central Detention Pond can be raised to a maximum elevation of 612. However, this is not sufficient to prevent the pond from overtopping during the 100-year storm events. Therefore, in addition to raising the berm to 612 at the Central Detention Pond, pumps were added to the pump station to prevent flooding of the intersection during the 100-year event. However, as previously discussed, the maximum pumping capacity is 80.1 cfs due to the sensitive outlet at Stony Creek downstream. Pumping at the maximum 80.1 cfs and raising the Central Detention Pond to 612 is not sufficient to prevent flooding. Therefore, this alternative looks at two sub-alternatives: Alternative 3a is similar to Alternative 2, and includes raising the Central Detention Pond to 612, providing a conveyance pipe to convey overflow from the Central Detention Pond to a proposed storage facility in the northwest infield, and adding a fourth pump to the pump station. Alternative 3b includes raising the Central Detention Pond to 612, providing storage in oversized pipes immediately downstream of the Central Detention Pond, and adding a fifth pump to the pump station.

Alternative 3a: Storage and Pumps, Storage at Northwest Infield (See Exhibit 2-04)
As shown in the TR-20 analyses, raising the Central Detention Pond berm to 612 will prevent overtopping of the Central Detention Pond during the 50-year storm events.

However, the 100-year storm still overtops. Alternative 3a includes conveying the overflow from the Central Detention Pond to a new detention facility in the northwest infield, adding a small detention facility in the southwest infield, and adding a fourth 8000 gpm pump at the pump station.

The overflow from the Central Detention Pond in the 100-year storm events will be conveyed to a proposed 4.8 acre-foot detention storage facility in the northwest infield. A 42" storm sewer at 1.7% slope will collect the overflow from the Central Detention Pond and convey it approximately 1000 feet along the northern right-of-way of 95th Street, across the railroad, and discharge to the proposed Northwest Infield pond. The proposed Northwest Infield pond will require a 2.5 acre footprint, and will discharge through a proposed 36-inch storm sewer at the same location and invert (582.25) as the existing inlet "D" (westbound 95th Station 616+03, 86' Lt.) The pond is designed to store the runoff from the 100-year, 24 hour storm event. The high water level of the pond in the 100-year, 24-hour storm is 586.18. The overflow spillway crest will be at elevation 588.5 to provide 2 feet of freeboard on the pond above the high water level, and the top of the berm will be at elevation 589.5.

This alternative also includes reconstruction of 270 feet of 36" and 42" pipe between the northwest infield and pump station, in order to convey the peak discharge from the northwest infield pond to the pump station during the 100-year storm event.

This alternative also includes construction of a small detention storage basin within the southwest infield to reduce the peak flow from the interchange itself into the pump station. The peak flow from the interchange occurs during the 2-hour storm event; however, the peak volume of runoff occurs during the 24-hour storm event. Therefore, the small infield detention storage basins are designed to store runoff from the 24-hour, 100-year event, which will reduce the peak flow to the pump station for all storm events.

The small pond is to be located adjacent to inlet "W" (eastbound 95th Station 705+65, 57' Rt.) in the southwest quadrant of the site. The pond will capture runoff from drainage area "W" and detain the runoff prior to discharge through the storm sewer system. The TR-20 hydrologic analysis shows that a pond 0.45 acres in size and 2.0 feet deep will provide 0.6 acre-feet of storage, which is sufficient to detain the runoff from this area during all storm events. Sufficient area exists within the infield area to modify the shape of the pond, if a smaller and deeper pond is preferred. The analysis assumes a 4-inch orifice restricting flow into the system at inlet "W" (eastbound 95th Station 705+65, 57' Rt.)

This alternative also includes addition of a fourth 8000 gpm pump, equal to the other three pumps, to convey runoff from the pump station during the 100-year storm event. The total pump station capacity in this alternative is 32,000 gpm or 71.2 cfs.

The critical duration storm for this alternative is the 100-year, 24-hour storm. All four pumps operate during the 100-year storm, and peak elevation in the wet well is 581.0. At the storm sewer in the infield adjacent to the low point on 95th Street, the rim elevation is 585.30, the low pavement elevation is 587.5 and the hydraulic grade line is 584.22. Approximately 1 foot of freeboard is provided below the rim and 3.3 feet of freeboard are provided below the low pavement elevation. The pavement does not appear to flood during the 100-year storm for this alternative.

The engineer's estimated opinion of probable construction cost for this alternative is approximately $2,407,973 as shown in Hydraulic Report Exhibit 79, which includes $1,840,529 for the pump station itself (with four pumps plus one stand-by) and $567,444 for other improvements. Note that this cost does not include any costs associated with crossing the railroad or other utilities with the new conveyance pipe. An additional annual cost is expected for operation and maintenance.

The stage-storage calculations can be found in Hydraulic Report Exhibits 44 and 45, and TR-20 hydrologic model can be found in Hydraulic Report Exhibit 60. The Hydra storm sewer model can be found in Hydraulic Report Exhibits 39 – 41 and 43. The pump flow diagrams and calculations for this alternative can be found in Hydraulic Report Exhibits 61-66.

Alternative 3b: Storage and Pumps, Storage in Oversized Pipes (See Exhibit 2-04)
As shown in the TR-20 analyses, raising the Central Detention Pond berm to 612 will prevent overtopping of the Central Detention Pond during the 50-year storm events. However, the 100-year storm still overtops. Alternative 3b includes providing additional storage immediately downstream of the Central Detention Pond's overtopping weir to further attenuate the peak discharge into the pump station.

This alternative includes construction of 1800' of 6'x6' reinforced concrete box culvert (or similar large-diameter pipe with equal storage volume) immediately downstream of the Central Detention Pond. Overflow from the Central Detention Pond will be conveyed into the oversized storm sewers, which will be laid three-across for 600' of length (1800' total length.) Connections between the three box culverts will be provided to equalize hydraulics between the box culverts. The box culverts will discharge to the storm sewer system at the location of the existing inlet A (westbound 95th Street Station 610+41, 50' Lt.) A 36" restrictor will be placed prior to discharge into inlet A. The storm sewers from inlet A to the wet well will be upsized to provide sufficient capacity for the additional flow.

This alternative also includes addition of a fifth pump, to bring the total pump station capacity to 80.1 cfs, equal to the existing pump station capacity. The fifth pump will have a capacity equal to 4000 gpm, or 8.9 cfs, which is one-half the size of the first four pumps, so as not to exceed the existing pump station discharge rate.

This alternative also includes construction of two small detention storage basins within the interchange infields to reduce the peak flow from the interchange itself into the pump station. The peak flow from the interchange occurs during the 2-hour storm event; however, the peak volume of runoff occurs during the 24-hour storm event. Therefore, the small infield detention storage basins are designed to store runoff from the 24-hour, 100-year event, which will reduce the peak flow to the pump station for all storm events.

One small pond is to be located adjacent to inlet "D" (westbound 95th Station 616+03, 86' Lt.) in the northwest quadrant of the site. The pond will capture runoff from drainage areas "D" and "F" and detain the runoff prior to discharge through the storm sewer system. The TR-20 analysis shows that a pond 0.65 acres in size and 1.7 feet deep will provide 0.45 acre-feet of storage, which is sufficient to detain the runoff from this area during all storm events. Sufficient area exists within the infield area to modify the shape of the pond, if a smaller and deeper pond is preferred. The analysis assumes a 4-inch orifice restricting flow into the storm sewer system at inlet "D."

The second small pond is to be located adjacent to inlet "W" (eastbound 95th Station 705+65, 57' Rt.) in the southwest quadrant of the site. The pond will capture runoff from drainage area "W" and detain the runoff prior to discharge through the storm sewer system. The TR-20 hydrologic analysis shows that a pond 0.45 acres in size and 2.0 feet deep will provide 0.6 acre-feet of storage, which is sufficient to detain the runoff from this area during all storm events. Sufficient area exists within the infield area to modify the shape of the pond, if a smaller and deeper pond is preferred. The analysis assumes a 4-inch orifice restricting flow into the system at inlet "W."

The critical duration storm for this alternative is the 100-year, 24-hour storm. All five pumps operate during the 100-year storm, and peak elevation in the wet well is 581.8. At the storm sewer in the infield adjacent to the low point on 95th Street, the rim elevation is 585.30, the adjacent low pavement elevation is 587.5 and the hydraulic grade line is 585.54. Water bubbles from the inlet during the 100-year storm, but approximately 2 feet of freeboard is provided below the pavement elevation. The pavement does not appear to flood during the 100-year storm for this alternative.

The engineer's estimated opinion of probable construction cost for this alternative is approximately $3,420,841 as shown in Hydraulic Report Exhibit 79, which includes $2,375,385 for the pump station itself (with five pumps plus one stand-by) and $1,045,456 for other improvements. An additional annual cost is expected for operation and maintenance.

The stage-storage calculations can be found in Hydraulic Report Exhibits 44 and 45, and TR-20 hydrologic model can be found in Hydraulic Report Exhibit 60. The Hydra storm sewer model can be found in Hydraulic Report Exhibits 39 – 41 and 43. The pump flow diagrams and calculations for this alternative can be found in Hydraulic Report Exhibits 61-66.

Recommendation

Alternative 1 is the preferred alternative. This alternative will prevent overtopping of the pond during the 50-year storm event and minimize flooding during the 100-year storm, does not require a storm sewer to be constructed across the railroad, and does not require the annual operations or maintenance costs associated with adding a fourth or fifth pump to the pump station. Coordination with the Village of Bridgeview and a survey and analysis of the storm sewer system downstream of the Central Detention Pond is required prior to proceeding with this alternative.

2-06 LOCAL AND OTHER AGENCY COORDINATION (see Appendix C)

☐ Yes	☒ No	Local ordinances considered
☐ Yes	☒ No	Joint participation

2-07 PROPOSED DRAINAGE PLAN

2-07.1 Roadway Drainage

☒ Yes ☐ No Utilize Existing Drainage System

Limits:

18" from DD (westbound 95th Street station 613+40, 166' Lt.) to B (westbound 95th Street Station 613+30, 57' Lt.)

18" from YY (westbound 95th Street Station 609+58, 46' Rt.) to Y (westbound 95th Street Station 611+51, 60' Rt.)

30" from A (westbound 95th Street Station 610+41, 50' Lt.) to Y (westbound 95th Street Station 611+51, 60' Rt.)

24" from Y (westbound 95th Street Station 611+51, 60' Rt) to 1424 (westbound 95th Street Station 614+22, 6' Rt.)

24" from EE (Harlem Avenue Station 325+74, 206' Lt.) to E (Harlem Avenue Station 324+00, 215' Lt.)

30" from UNK-1 (eastbound 95th Street 703+48, 24' Rt) to the wet well

48" from BB (westbound 95th Street Station 614+69, 61' Rt) to the wet well

54" from the pump station to X (Harlem Avenue Station 314+80, 194' Lt.)

60" from V (Harlem Avenue Station 314+10, 103' Rt.) to S (Harlem Avenue Station 313+45, 151' Rt.)

24" from N (westbound 95th Street Station 628+66, 158' Lt) to AA (westbound 95th Street Station 629+72, 93' Rt.)

30" from E (Harlem Avenue Station 324+00, 215' Lt) to CC (Harlem Avenue Station 321+09, 102' Rt.)

66" from UNK-2 (Harlem Avenue Station 321+08, 124' Rt) to S (Harlem Avenue Station 313+45, 151' Rt.)

Comments:

See Exhibit 30 in Appendix D for a correlation of drainage IDs listed in this document and the Station/Offset of those structures.

Note, the list shown above applies to Alternatives 1 and 2 only. In Alternative 3a, the storm sewer from UNK-1 to the wet well is replaced, and in Alternative 3b the storm sewer from A to Y and from Y to 1424 is replaced. See Exhibit 2-00b.

☒ Yes ☐ No Utilize existing storm sewers with minor extensions and/or adjustment of existing drainage structures

Limits for minor extensions due to roadway widening:

15" from W (eastbound 95th Street Station 705+65, 57' Rt) to 1483 (eastbound 95th Street Station 704+60, 24' Rt.)

15" from D (westbound 95th Street Station 616+03, 86' Lt) to UNK-1 (eastbound 95th Street Station 703+48, 24' Rt.)

18" from F (westbound 95th Street station 618+09, 74' Lt) to 1483 (eastbound 95th Street Station 704+60, 24' Rt.)

24" from M (westbound 95th Street Station 626+30, 25' Lt) to P (eastbound 95th Street Statin 713+73, 93' Rt.)

42" from 1424 (westbound 95th Street Station 614+22, 6' Rt) to BB (westbound 95th Street Station 614+69, 61' Rt.)

Limits for minor adjustment of drainage structures:

12" from C (Harlem Avenue Station 324+20, 344' Lt) to E (Harlem Avenue Station 324+00, 215' Rt.)

Comments:

Note, the above list applies only to Alternatives 1 and 2. In Alternative 3a, the storm sewer from D (westbound 95th Street Station 616+03, 86' Lt) to UNK-1 (eastbound 95th Street Station 703+48, 24' Rt) is replaced, and in Alternative 3b, the storm sewer from 1424 (westbound 95th Street Station 614+22, 6' Rt) to BB is replaced (westbound 95th Street Station 614+69, 61' Rt.) See Exhibit 2-00b.

☐ Yes ☒ No Utilize existing combined sewers with minor extensions and/or adjustment of existing drainage structures

☒ Yes ☐ No Regrade/reestablish existing ditches

Limits:

Outside Frontage E to inlet N (westbound 95th Street Station 628+66, 158' Lt.)

Outside Ramp G to inlet S (Harlem Avenue Station 313+45, 151' Rt.)

☒ Yes ☐ No Regrade/reestablish existing swales

Limits:

Inside of Ramp H to inlet Q (Harlem Avenue Station 317+51, 302' Rt.)

South of Ramp G

South of 95th Street, east of Ramp H to inlet P (eastbound 95th Street Station 713+73, 93' Rt.)

South of 95th Street, west of Harlem to BB (westbound 95th Street Station 614+69, 61' Rt.)

South of Ramp B to inlet X (Harlem Avenue Station 314+80, 194' Lt.)

South of Ramp H, north of Ramp G to inlet P (eastbound 95th Street Station 713+73, 93' Rt.)

West of Harlem, East of new Ramp D, to inlet CC (Harlem Avenue Station 321+09, 102' Lt.)

West of Harlem, East of new Ramp D, to inlet "New" (westbound 95th Street Station 619+25, 80' Lt.)

Outside Ramp F to inlet M (westbound 95th Street Station 626+30, 25' Lt.)

Inside Ramp F to inlet L (westbound 95th Street Station 624+74, 109' Lt.)

Outside Frontage E to inlet N (westbound 95th Street Station 628+66, 158' Lt.)

☒ Yes ☐ No Replace/relocate existing storm sewers

Limits and sizes:

Relocate 24" from 1483 (eastbound 95th Street Station 704+60, 24' Rt) to UNK-1 (eastbound 95th Street 704+60, 24' Rt) to accommodate roadway widening

Replace 30" from B (westbound 95th Street Station 613+30, 57' Lt) to 1424 (westbound 95th Street Station 614+22, 6' Rt.) with a 30" at greater slope

Replace 15" from L (westbound 95th Street Station 624+74, 109' Lt.) to UNK-2 (Harlem Avenue Station 321+08, 124' Rt) with an 15" at greater slope.

Replace 48" from AA (westbound 95th Street Station 629+72, 93' Rt.) to P (eastbound 95th Street Station 713+73, 93' Rt) with a 54"

Replace 48" from P (eastbound 95th Street Station 713+73, 93' Rt) to Q (Harlem Avenue Station 317+51, 302' Rt) with a 54"

Replace 48" from Q (Harlem Avenue Station 317+51, 302' Rt) to UNK-3 (Harlem Avenue Station 317+08, 138' Rt) with a 60"

Replace 60" from X (Harlem Avenue Station 314+80, 194' Lt) to V (Harlem Avenue Station 314+10, 103' Rt) with a 60" at a flatter slope

Replace 18" – 60" from FF (Harlem Avenue Station 325+33, 181' Rt) to UNK-2 (Harlem Avenue Station 321+08, 124' Rt) with equal diameter pipes at flatter slopes

Replace 36" from CC (Harlem Avenue Station 321+09, 102' Lt.) to UNK-2 (Harlem Avenue Station 321+08, 124' Rt) with a 36" pipe at greater slope

Relocate catch basin at Harlem Avenue Station 299+20, 44' Right to curbline.

Comments:

Sewer replacement from 1483 (eastbound 95th Street Station 704+60, 24' Rt) to UNK-1 (eastbound 95th Street 704+60, 24' Rt) is necessary to accommodate roadway widening.

Catch basin relocation at Harlem Avenue Station 299+20, 44' Right is necessary to capture runoff from Harlem Avenue and reduce drainage problems.

Other replacements are required to achieve sufficient capacity to convey gravity flow or to meet velocity requirements.

Note, the above list applies only to Alternatives 1 and 2.

In Alternative 3a, the following storm sewers are also replaced:

Replace 30" from UNK-1 (eastbound 95th Street Station 703+48, 24' Rt) to the wet well with a 36".

Replace 15" from D (westbound 95th Street Station 616+03, 86' Lt) to UNK-1 (eastbound 95th Street Station 703+48, 24' Rt) with a 36".

In Alternative 3b, the following storm sewers are also replaced:

Replace 42" from 1424 (westbound 95th Street Station 614+22, 6' Rt.) to BB (westbound 95th Street Station 614+69, 61' Rt.) with a 48"

Replace 30" from A (westbound 95th Street Station 610+41, 50' Lt.) to Y (westbound 95th Street Station 611+51, 60' Rt.) with a 48"

Replace 24" from Y (westbound 95th Street Station 611+51, 60' Rt) to 1424 (westbound 95th Street Station 614+22, 6' Rt.) with a 42"

☐ Yes ☒ No Replace/relocate existing combined sewers

☐ Yes ☒ No Abandon existing storm sewers

☐ Yes ☒ No Abandon existing combined sewers

☒ Yes ☐ No Regrade/reestablish/maintain existing outlets

Limits and sizes: Maintain existing 72" outlet from storm sewer system into Stony Creek.

Maintain 15" outlet from Central Detention Pond.

Maintain 42" outlet into southwest quadrant of intersection.

☐ Yes ☒ No Maintain/replace/extend existing cross road culverts

☒ Yes ☐ No Construct new storm sewers

Limits and sizes:

12" from area New to inlet F (westbound 95th Street Station 618+09, 74' Lt) at 0.38% slope

12" from area K1 to inlet K (Harlem Avenue Station 323+19, 84' Rt) at 0.30% slope

Comments: Above list for Alternative 1 only.

Alternative 2 and 3a: new 1000' - 42" storm sewer from Central Detention Pond overflow to Northwest infield pond.

Alternative 3b: new 600' triple 6'x6' box culvert (or equivalent) from Central Detention Pond overflow to inlet A (westbound 95th Street Station 610+41, 50' Lt.)

☐ Yes ☒ No Construct new combined sewers

☒ Yes ☐ No Construct special drainage structures

Limits and types:

See Section 2-03.

Comments: See Exhibit 2-03 for non-clog restrictor detail.

☐ Yes ☒ No Construct new ditches (standard ditches desired)

☒ Yes ☐ No Construct new swales

Limits:

North of Ramp B to inlet W (eastbound 95th Street Station 705+65, 57' Rt)

Outside of new Ramp D to inlet F (westbound 95th Street Station 618+09, 74' Lt)

North of 95th Street, west of Ramp D, to inlets D (westbound 95th Street Station 616+03, 86' Lt) and B (westbound 95th Street Station 613+30, 57' Lt.)

Outside Ramp F to inlet K-1 (Harlem Avenue Station 323+25, 80' Rt.)

☐ Yes ☒ No Construct new outlets

☐ Yes ☒ No Construct new cross road culverts

☐ Yes ☒ No Stormwater detention to be provided (See Section 2-03)

☐ Yes ☒ No Compensatory storage for floodway to be provided (See Section 3-00)

2-07.2 Proposed Action for Major Drainage Features

Pump Station: It is recommended that the existing pump equipment be replaced with three 8000 gpm (17.8 cfs) pumps plus one stand-by 8000 gpm (17.8 cfs) pump, as well as a 100 gpm (0.22 cfs) de-watering pump and 1200 gpm (2.67 cfs) low-flow pump. The total firm capacity is 53.5 cfs. The hydraulic grade line for the design storm (50-year storm with 10-year tailwater) is a minimum of two feet below the rim elevations for the mainline storm sewer which is adjacent to the low point of the roadway. The low point of the roadway profile is on 95th Street at Eastbound Station 700+50. The

low point of the roadway is 587.5, and lowest inlets in the infield adjacent to the roadway are at elevation 585.30. The proposed hydraulic grade line elevation at that inlet is 582.80 in the 50-year storm with 10-year tailwater for Alternatives 1 and 3, and lower for Alternative 2.

3-00 FLOODPLAIN ENCROACHMENT EVALUATION

The proposed project has been reviewed in accordance with Executive Order 11988 "Floodplain Management"; Section 6-261, "Floodplains" as contained in the Illinois Department of Transportation, Bureau of Location and Environment (BLE) Manual of Policies and Procedures (Volume 1); Drainage Manual; and 92 Illinois Administration Code 3708 "Floodway Construction in Northeastern Illinois."

☒ No Potential Floodplain Encroachment

Bureau of Maintenance
Flood Location Data

Comm. Center Report Number _____
(Ask Dispatcher)

Location: (Route) 95TH ST. Municipality BRIDGEVIEW

Date: 6-7-93 Time notified: 11:00 A.M. Time at scene: 11:30 AM

Source of notification: LOCAL POLICE
(If other than Comm. Center - Notify Comm. Center)

DETAILS OF FLOODED LOCATION

Pavement flooding @ I-294 AND RT. 43

Direction ALL DIRECTIONS
Lanes involved FOUR
Average depth of water SIX INCHES
Length of standing water 200 FT.
Passable to automobile traffic Yes _____ No ✓

R.O.W. flooding

Shoulder _____ Parkway ✓
Direction ALL DIRECTION
Average depth of water SIX INCHES
Length of standing water 200 FT.

Apparent cause of flooding PUMP STATION FAILURE

Corrective measures implemented: ROAD CLOSED UNTIL WATER DOWN

Duration of Closure THREE HOURS
Name of Reporter JAMES TECH
Phone: TCF 448-0050

Re: Illinois Route 43 (Harlem Avenue) @ US Route 12/20 (95th Street)
Interchange Reconstruction

Dear Mr. Godowski:

My sincere thanks to both IDOT staff members and representatives from the project design consultant, Earth Tech, for attending the public information meeting held at the Chicago Ridge Village Hall on Wednesday, August 22, 2001, for the purpose of explaining the above subject project to our residents. I believe that the display of the proposed interchange layout and the project details provided those in attendance with a clear indication of the proposed improvements. I am also confident that the questions and concerns voiced by the residents were answered in a responsive and honest manner. Following is a summary of the comments noted during discussions with our residents, which are being presented for your further review and consideration.

The first area of concern that needs to be addressed, as a result of the proposed project, is the issue of increased traffic noise and safety. According to the calculation sheets provided by IDOT, there will be a dramatic increase in the peak hour traffic volumes for the proposed eastbound 95th Street ramp to north/south bound Harlem Avenue and the proposed north/south bound Harlem Avenue exit ramp to eastbound 95th Street. The increase in traffic volumes is primarily due to the elimination of the northwest and southwest cloverleaf ramps and adding their volumes to the existing northbound Harlem Avenue and eastbound 95th Street ramps. The projected peak hour traffic volumes for these two (2) ramps will nearly double by the year 2020 as a result of combining the peak hour traffic. Residents living adjacent to the southeast and northeast quadrants of the intersection are concerned that the increased traffic will increase noise and place that many more vehicles per day near their homes. These residents have requested that a landscaped noise and vehicle barrier be considered to both control the increased noise levels as a result of the added traffic and to also provide a greater degree of safety from vehicles traveling the ramps adjacent to their rear yards.

Several residents felt that the ramp to eastbound 95th Street could be reconstructed in a new location that would be further away from the rear yards of the homes that abut the existing ramp in its current location. There was a general feeling by these residents that adequate land is available within the IDOT right-of-way to accomplish total reconstruction of the ramp to a location which is north of the existing ramp.

Village residents who live in the northeast quadrant of the intersection have a concern for the close proximity of their houses to the ramp from eastbound 95th Street to north/south bound Harlem Avenue. This concern is especially true when traffic is stopped to wait for the signal located at the top of the ramp as it intersects with Harlem Avenue. On their behalf, we request that a landscaped noise barrier be constructed between this ramp and the homes/residences.

At least one (1) resident expressed their opinion that the vast amount of vacant space within the grade-separated intersection needs to be extensively landscaped, especially along the ramps and viaducts, to create a more pleasant entry into each of the communities that border the intersection.

Another resident theorized that, since the State will be adding two (2) sets of traffic signals on Harlem Avenue, IDOT should also consider another alternate design which would revert the grade-separated intersection back to an at-grade, 4-way, traffic signalized intersection. This type of plan would take away all of the ramps and create more distance between the approaches to intersection and the residential properties.

On August 2, 2001, an unexpected rainstorm deposited approximately 3½" of rainfall within an hour in several communities, including the Village of Oak Lawn. During this event, residents whose yards back up to the interchange ramp embankment for northbound Harlem Avenue to eastbound 95th Street noticed a substantial amount of water cascading down the embankment into their community. They have asked that the State conduct an investigation to determine the source of this runoff and to make sure that the proposed improvements will contain and control any such storm water runoff so it can be properly routed to a State storm sewer outfall.

The final, but certainly not least important, item of concern is the type of roadway lighting that will be selected for installation as part of this improvement. In consideration of the residents whose homes are immediately adjacent to the State right-of-way, the Village asks that the design parameters for the roadway lighting take into account any and all stray lighting patterns that may trespass beyond the right-of-way and impact the tranquility of homes and yards in this neighborhood.

Please include these comments as part of the record for the public meeting. Should you have any questions or need additional information concerning any of the items described above, please do not hesitate to contact the writer at your convenience.

Very truly yours,

Lynn J. Krauss, P.E.

Note 1: The storm sewer between B and 1424 has a negative slope, and so it does not convey via gravity flow. The upstream end of the pipe at B can be raised to meet the invert of the pipe flowing into B. This will provide adequate positive slope, and the sewer from B - 1424 will convey via gravity flow.

Note 2: The slope of the storm sewer between UNK-2 and Z can be decreased and the slope of the storm sewer between L and UNK-2 can be increased to provide conveyance via gravity flow in the sewer between L and UNK-2.

Note 3: The slopes of these sewers are adjusted to meet the velocity criteria.

28	UNK-3 - R	601.17	599.00	596.58	594.99				
29	R - S	599.00	599.16	594.99	593.54				
30	S - END	599.16	591.40	593.54	589.30				

Notes:

1. Values given for 50-yr storm upstream for Alt 1 reflects a discharge to a wetwell HWL of 580.3. Alt 2 discharges to a wetwell HWL of 580.1, and therefore would produce a hydraulic grade line equal to or lower than Alt 1.

2. Values given for 100-yr storm upstream of the wetwell reflect Alt 2, which discharges to a wetwell HWL = 581.2. Alt 1 discharges to wetwell HWL = 580.1, and therefore would produce values equal to or lower than those for Alt 2.

3. The HGL of links 6, 7, and 8 upstream of the pump station has been adjusted. Hydra calculated a HGL at node 1424 at the downstream end of link 8 which was lower than the HGL at node 1424 at the upstream end of link 11. Links 6, 7 and 8 have been adjusted to reflect the higher HGL.

Note 1: The storm sewer between B and 1424 has a negative slope, and so it does not convey via gravity flow. The upstream end of the pipe at B can be raised to meet the invert of the pipe flowing into B. This will provide adequate positive slope, and the sewer from B - 1424 will convey via gravity flow.

Note 2: The slope of the storm sewer between UNK-2 and Z can be decreased and the slope of the storm sewer between L and UNK-2 can be increased to provide conveyance via gravity flow in the sewer between L and UNK-2.

Note 3: The slopes of these sewers are adjusted to meet the velocity criteria.

NOTES:
1. SOME SMALL LATERALS HAVE BEEN ELIMINATED FOR SIMPLICITY.
2. INDIVIDUAL INLETS ARE NOT SHOWN.
3. STORM SEWER SYSTEMS SHOWN IN THIS PLAN REPRESENT DRAINAGE ALTERNATIVES 1 AND 2.
4. CONTOURS REFLECT THE EXISTING CONDITION AND DO NOT REPRESENT PROPOSED GRADES.
5. DITCH ALONG THE TOE OF RAMP G TO BE REGRADED TO PROVIDE A POSITIVE SLOPE TO STORM SEWER SYSTEM.
6. 0.45 ACRE-FOOT DETENTION POND (0.65 ACRES, 1.7 FEET DEEP) WITH 4-INCH RESTRICTOR IN INLET D TO BE CONSTRUCTED FOR ALTERNATIVES 1 AND 3b. AN 18.0 ACRE-FOOT DETENTION POND(3.2 ACRES, 9 FEET DEEP) WITH EXISTING 15" OUTLET AT D TO BE CONSTRUCTED FOR ALTERNATIVE 2. A 4.8 ACRE-FOOT DETENTION POND (2.5 ACRES, 4 FEET DEEP) WITH PROPOSED 36" OUTLET AT D TO BE CONSTRUCTED FOR ALTERNATIVE 3a.
7. 0.60 ACRE-FOOT DETENTION POND (0.45 ACRES, 2.0 FEET DEEP) TO BE CONSTRUCTED FOR ALTERNATIVES 1, 2, 3a AND 3b. 4" RESTRICTOR TO BE PLACED IN INLET W.
8. BERM ALONG SOUTHERN AND SOUTHWESTERN EDGE OF CENTRAL DETENTION POND TO BE RAISED TO ELEVATION 611 FOR ALTERNATIVES 1 AND 2 WITH OVERTOPPING WEIR AT ELEVATION 610.5, AND 612 WITH OVERTOPPING WEIR AT 611.5 FOR ALTERNATIVES 3a AND 3b. IN ADDITION, 15" RESTRICTOR TO BE REPLACED WITH 24" RESTRICTOR FOR ALTERNATIVE 2.
9. 12" STORM SEWER TO BE REPLACED WITH 1800'-6'X6' BOX CULVERT (OR VOLUMETRICALLY EQUIVALENT PIPE) FOR ALTERNATIVE 3b.
